

# Why File Table?

## Where To Put File Position Info?

**Inode table?** No. Multiple processes can open the same file. Each one has its own file position.

**User file descriptor table?** No. Trouble in file sharing.

## Example

```
1  #!/bin/bash
2
3  echo hello
4  echo world
```

\$ ./hello.sh > A

? Where should the “world” be?
