What's A Computer Network?

The History of Internet I

1836: Telegraph

1858-66: Transatlantic cable

1876: Telephone

1957: USSR launches Sputnik

1962-68: *Packet-switching* networks developed

1969: Birth of Internet

1971: People communicate over a network

1972: Computers can connect more freely and easily

1973: Global Networking becomes a reality

1974: Packets become mode of transfer

1976: Networking comes to many

The History of Internet II

1977: E-mail takes off, Internet becomes a reality

1979: News Groups born

1981: Things start to come together

1982: *TCP/IP* defines future communication

1983: Internet gets bigger

1984: Growth of Internet Continues

1986: Power of Internet Realised

1987: Commercialisation of Internet Born

1989: Large growth in Internet

1990: Expansion of Internet continues

1991: Modernisation Begins

The History of Internet III

1992: Multimedia changes the face of the Internet

1993: The WWW Revolution truly begins

1994: Commercialisation begins

1995: Commercialisation continues apace

1996: Microsoft enters

1998: Google

Homework: Meanwhile, what happened in China?

What's The Internet?

What pops up in your mind if I say “Internet”?

What's The Internet?

What pops up in your mind if I say "Internet"?

For me, the answer is...

and...

What's The Internet?

What pops up in your mind if I say “Internet”?

For me, the answer is...

The Google logo, featuring the word "Google" in its characteristic multi-colored font: blue 'G', red 'o', yellow 'o', blue 'g', green 'l', and red 'e'.

and...

TCP/IP

What's The Internet?

- ▶ The network of networks.
- ▶ Tech view: TCP/IP
- ▶ App view: Google

Google Philosophy

Ten things Google has found to be true

1. Focus on the user and all else will follow.
2. It's best to do one thing really, really well.
3. Fast is better than slow.
4. Democracy on the web works.
5. You don't need to be at your desk to need an answer.
6. *You can make money without doing evil.*
7. There's always more information out there.
8. The need for information crosses all borders.
9. You can be serious without a suit.
10. Great just isn't good enough.

Google Philosophy

More about...

- ▶ Software Principles
- ▶ Google User Experience
- ▶ No pop-ups
- ▶ Security

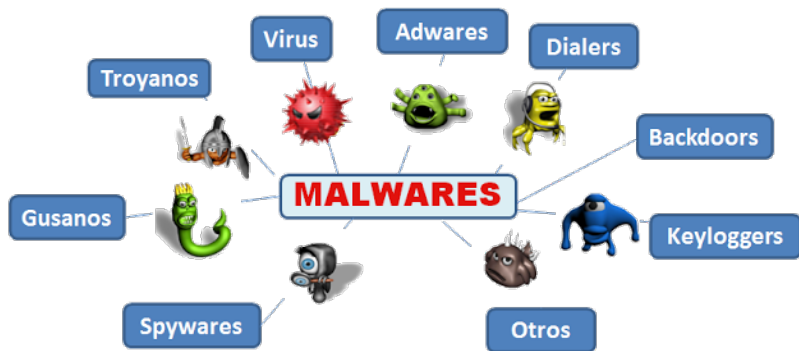

Choosing The Right Tools

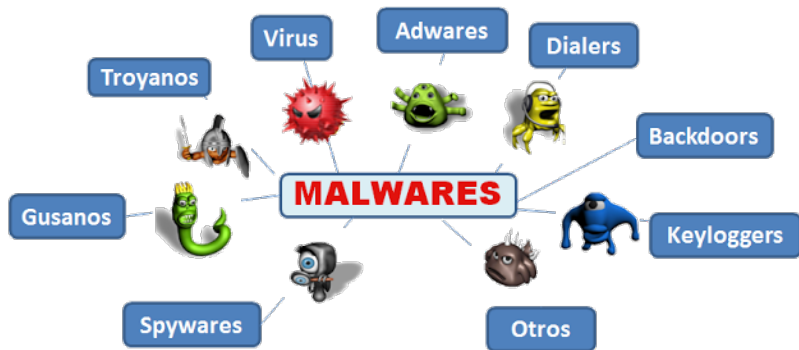

vs.

Dangerous

Dangerous

My solution

Safe Surfing Advice

Take care of your identity and privacy

- ▶ Use a better browser, and keep it updated
- ▶ Use a spam filter for emailing
- ▶ Always use strong passwords
- ▶ Don't give away too much personal information on blogs and social networking sites

Safe Surfing Advice

Protect Your PC

- ▶ Get anti-virus software, anti-spyware software and a firewall
- ▶ Keep your computer up to date
- ▶ Block spam emails
- ▶ Use an up to date web browser
- ▶ Make regular backups
- ▶ Encrypt your wireless network

Safe Surfing Advice

Avoid online rip-offs

- ▶ When you're shopping online, look for clear signs that you're buying from a reputable company
- ▶ On an online auction site, learn how it works and learn to pick good sellers
- ▶ Use safe ways to pay, such as PayPal or credit and debit cards
- ▶ Use your common sense to avoid scams – if it sounds too good to be true, it probably is

Homework

1. try 
2. get a [gmail](#) account
3. recommend a good [chrome extension](#) to me via gmail
4. in [google plus](#), share an interesting post to me
5. add your class timetable into [google calendar](#), and then share your calendar to me
6. in [youtube](#), find a video you like and share it to me

Network Classification

- ▶ connection method: wired, wireless...
- ▶ topology
- ▶ scale
- ▶ network architecture: c/s, p2p...

TCP/IP

What's TCP/IP?

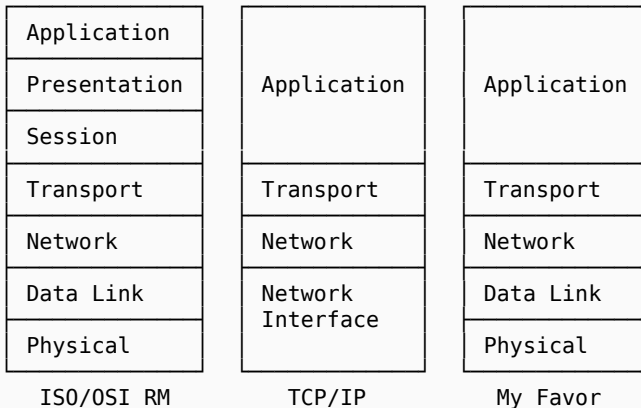

A set of protocols designed for the Internet

Protocol — a rule, a treaty, an agreement ...

TCP/IP Protocol Stack

Every networked computer has it inside

Layered Design

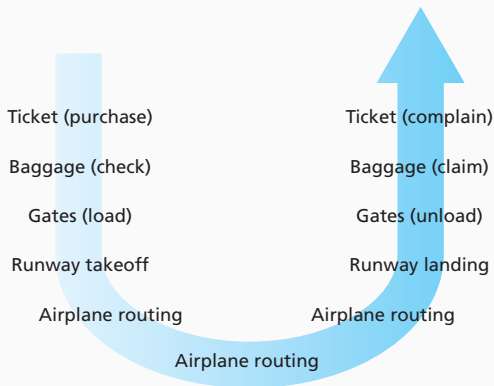

Services vs. Protocols

Services	Protocols
Layer to Layer	Peer to Peer
A set of operations (listen, connect, accept, receive, send, disconnect)	A set of rules (message format, message meanings)

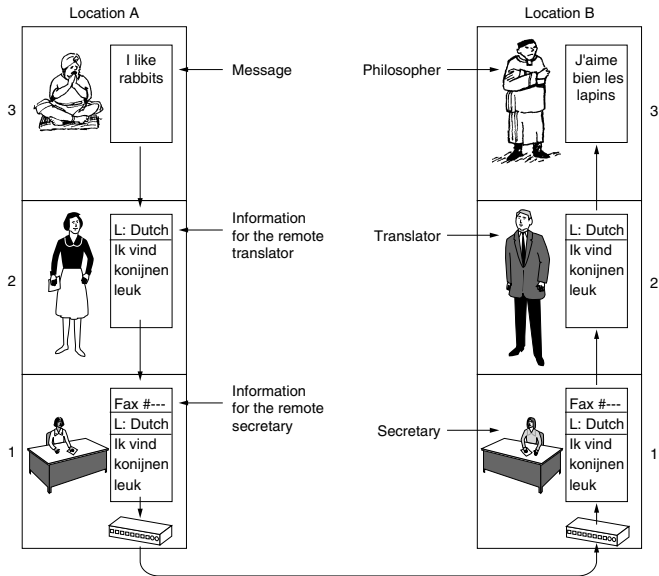

Layered Design Example

Taking an airplane trip

Each layer

1. has some functions
2. provides services to its upper layer

Each protocol is completely independent of the other ones

For example

- ▶ The translators (L2) can switch from Dutch to Finnish without touching L1 or L3
- ▶ The secretaries (L1) can switch from email to telephone without disturbing (or even informing) the other layers

TCP/IP Overview

Basic Structure

1. Where will an incoming Ethernet frame go?

0x0806 → ARP

0x0800 → IP

2. Where will an incoming IP packet go?

0x06 → TCP

0x11 → UDP

3. Where will an incoming transport message (UDP datagram, TCP segment) go?

HTTP	FTP	SSH	SMTP
80	21/20	22	25

The Name Of A Unit Of Data

A Application message

T TCP segment; UDP datagram

N IP packet

L Ethernet frame

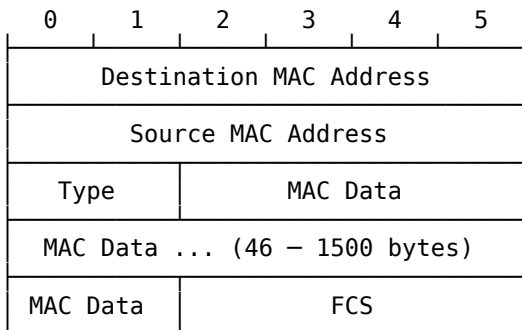

Ethernet 2
IP network "accounting", 223.1.3

Ethernet

1. Frame format?
2. Address format?
3. Broadcast address?
4. CSMA/CD?

Ethernet Frame

Examples

Unicast, carrying an IP packet

Destination	Source	Type	MAC Data	
08005A21A722	0800280038A9	0x0800	IP packet	FCS

Unicast, carrying an ARP packet

Destination	Source	Type	MAC Data	
0800280038A9	08005A21A722	0x0806	ARP Response	FCS

Broadcast, carrying an ARP packet

Destination	Source	Type	MAC Data	
FFFFFFFFFFFF	0800280038A9	0x0806	ARP Request	FCS

ARP

ARP Looking up the ARP table to find the destination MAC address.

Example ARP table

IP address	Ethernet address
223.1.2.1	08-00-39-00-2F-C3
223.1.2.3	08-00-5A-21-A7-22
223.1.2.4	08-00-10-99-AC-54

Where does the ARP table come from?

Example ARP Request

Sender IP Address	223.1.2.1
Sender Eth Address	08-00-39-00-2F-C3
Target IP Address	223.1.2.2
Target Eth Address	FF-FF-FF-FF-FF-FF

Example ARP Response

Sender IP Address	223.1.2.2
Sender Eth Address	08-00-28-00-38-A9
Target IP Address	223.1.2.1
Target Eth Address	08-00-39-00-2F-C3

The updated table

IP address	Ethernet address
223.1.2.1	08-00-39-00-2F-C3
223.1.2.2	08-00-28-00-38-A9
223.1.2.3	08-00-5A-21-A7-22
223.1.2.4	08-00-10-99-AC-54

ARP References

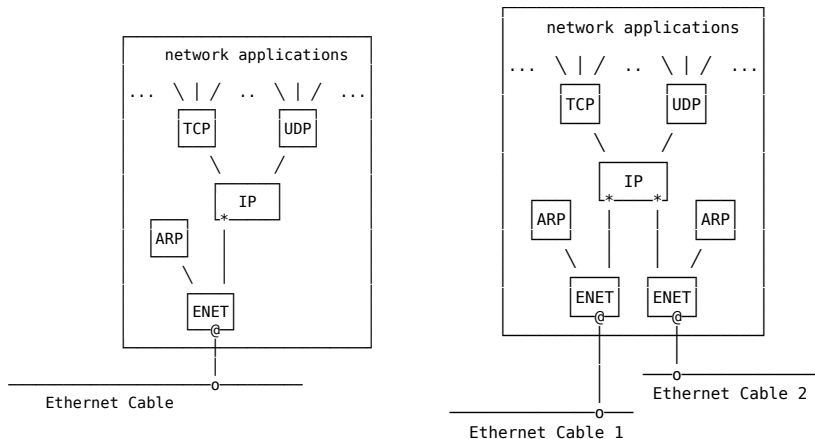

Wikipedia. Address Resolution Protocol — Wikipedia, The Free Encyclopedia. 2015. http://en.wikipedia.org/w/index.php?title=Address_Resolution_Protocol&oldid=647148843.

PLUMMER D. An Ethernet Address Resolution Protocol: Or Converting Network Protocol Addresses to 48.bit Ethernet Address for Transmission on Ethernet Hardware. RFC Editor. 1982. <https://www.rfc-editor.org/rfc/rfc826.txt>.

IP

Router

Routing Find a route in the route table.

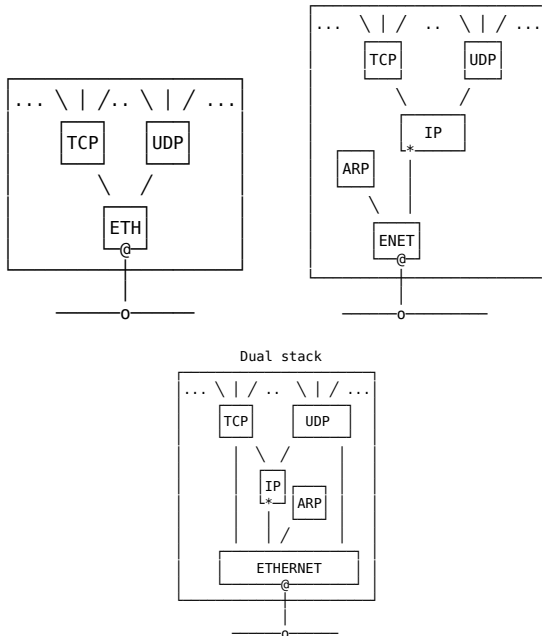

Direct Routing—IP is overhead

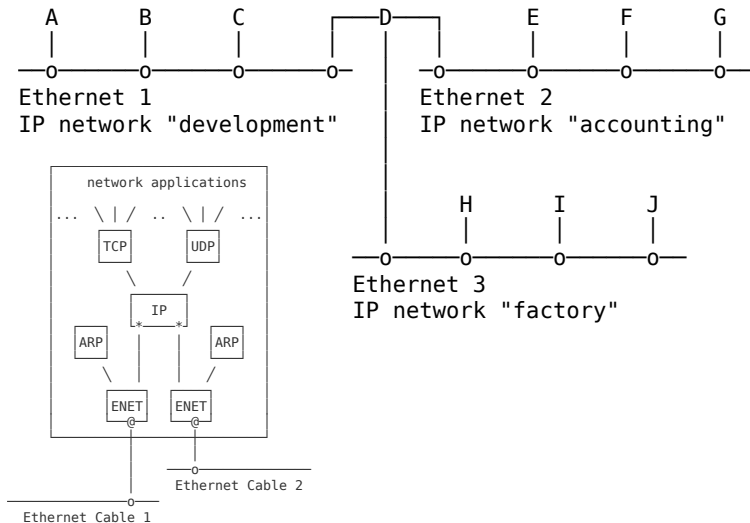

Addresses in an Ethernet frame for an IP packet from A to B

address	source	destination
IP	A	B
Eth	A	B

Is IP Necessary?

Indirect Routing

Addresses in an Ethernet frame for an IP packet from A to E (before D)

address	source	destination
IP	A	E
Eth	A	D

Addresses in an Ethernet frame for an IP packet from A to E (after D)

address	source	destination
IP	A	E
Eth	D	E

IP Module Routing Rules

1. For an outgoing IP packet, entering IP from an upper layer, IP must decide
 - ▶ whether to send the IP packet directly or indirectly, and
 - ▶ IP must choose a lower network interface.

These choices are made by consulting the route table.

2. For an incoming IP packet, entering IP from a lower interface, IP must decide
 - ▶ whether to forward the IP packet or pass it to an upper layer.
 - ▶ If the IP packet is being forwarded, it is treated as an outgoing IP packet.

3. When an incoming IP packet arrives it is never forwarded back out through the same network interface.

IP Address

An IPv4 address (dotted-decimal notation)

172 . 16 . 254 . 1

10101100.00010000.11111110.00000001

One byte = Eight bits

Thirty-two bits (4 x 8), or 4 bytes

Address classes

0~127

128~191

192~223

224~255

Prefix

Special IP Addresses

- ▶ A value of zero in the network field means this network.
(source only)
- ▶ A value of zero in the host field means network address.
- ▶ 127.x.x.x are loopback address.
- ▶ 255.255.255.255 is boardcast address.
- ▶ Private address:
 - ▶ 10.x.x.x
 - ▶ 172.16.x.x~172.31.x.x
 - ▶ 192.168.x.x
- ▶ CIDR—Classless Inter-Domain Routing—An IP addressing scheme that replaces the older system based on classes A, B and C.

Names

People refer to computers by names, not numbers.

```
/etc/hosts
```

```
127.0.0.1      localhost
202.203.132.245 cs3.swfu.edu.cn  cs3
```

```
/etc/networks
```

```
localnet      202.203.132.192
```

IP Route Table

Example IP Route Table

```
~$ route
```

```
Kernel IP routing table
```

Destination	Gateway	Iface
localnet	*	eth0
192.168.128.0	*	eth0
default	202.203.132.254	eth0

```
~$ man route
```

Direct Routing Details

The route table inside alpha (simplified)

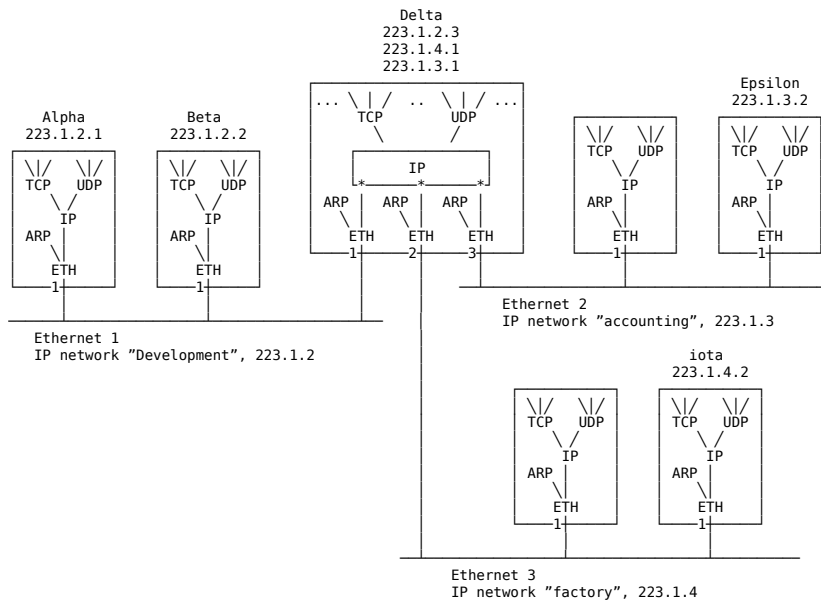

network	flag	router	interface
development	direct		1

Homework

Alpha is sending an IP packet to beta...Please describe.

Indirect Routing Details

Indirect Routing Details

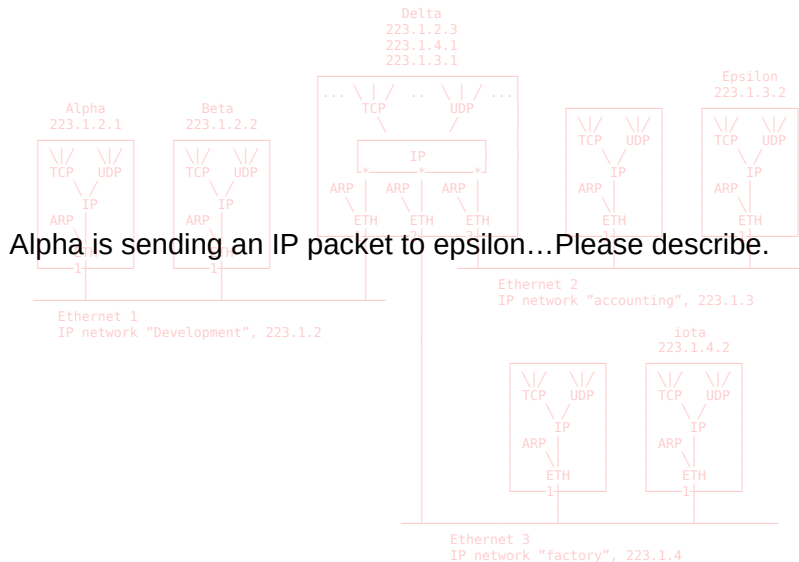

The route table inside alpha

network	flag	router	interface
223.1.2	direct		1
223.1.3	indirect	223.1.2.4	1
223.1.4	indirect	223.1.2.4	1

The route table inside delta

network	flag	router	interface
223.1.2	direct		1
223.1.3	direct		3
223.1.4	direct		2

Homework

Managing The Routes

- ▶ Manually maintained by administrator
- ▶ ICMP can report some routing problems
- ▶ For larger networks, routing protocols are used.

IP Packet

0		1	2	3
Version	IHL	Type of Service	Total Length	
Identification			Flags	Fragment Offset
Time to Live		Protocol	Header Checksum	
Source Address				
Destination Address				
Options (variable)				Padding

IP References

Why Subnetting?

- ▶ save address space
- ▶ restrict collision domain
- ▶ security
- ▶ physical media (Ethernet, FDDI, ...)

How

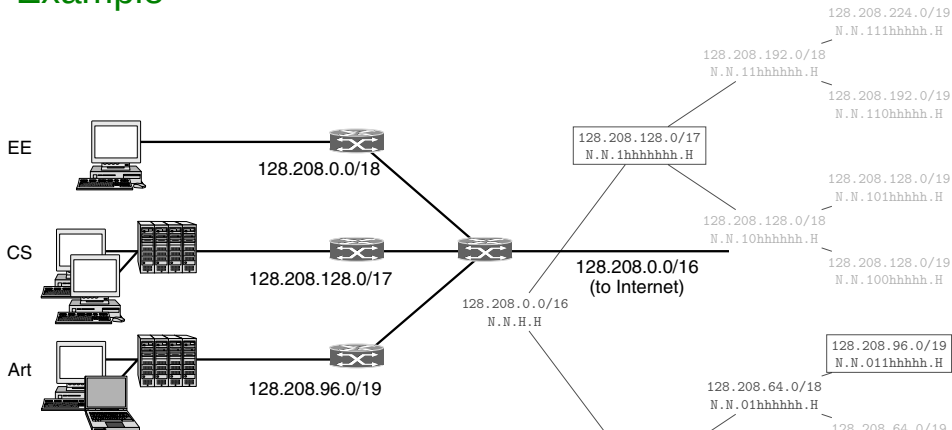

Subnet mask is a bitmask used to identify the network and node parts of the address.

Default Subnet Masks

Class A	255.0.0.0	11111111.0.0.0
Class B	255.255.0.0	11111111.11111111.0.0
Class C	255.255.255.0	11111111.11111111.11111111.0

Example

CS: 10000000.11010000.1xxxxxxx.xxxxxxxx
 EE: 10000000.11010000.00xxxxxxx.xxxxxxxx
 ART: 10000000.11010000.011xxxxxx.xxxxxxxx

$$2^n - 2$$

Example

IP address:	11001010.11001011.10000100.11110001
	202 . 203 . 132 . 241
Subnet mask:	11111111.11111111.11111111.11000000
	255 . 255 . 255 . 192

- ▶ There are $2^2 - 2 = 2$ subnets
- ▶ Each subnet has $2^6 - 2 = 62$ nodes
- ▶ Subtract 2? All "0"s and all "1"s. (old story)

Subnet Calculator

free IP subnet calculators

Try:

```
~$ subnetcalc 202.203.132.244/26
```

```
~$ ipcalc 202.203.132.244/26
```

```
~$ sipcalc 202.203.132.244/26
```

Quiz

Consider a packet addressing 128.208.2.251

Q1: Which subnet it belongs to?

Q2: The route table inside each router?

Subnetting References

CIDR—Classless Inter-Domain Routing

CIDR An IP addressing scheme that replaces the older system based on classes A, B and C.

Why?

With a new network being connected to the Internet every 30 minutes the Internet was faced with two critical problems:

- ▶ Running out of IP addresses
- ▶ Running out of capacity in the global routing tables

Two-Level Internet

Network – Host

Running out of IP addresses

Using the old addressing scheme, the Internet could support:

- ▶ 126 Class A networks that could include up to 16,777,214 hosts each
- ▶ Plus 65,000 Class B networks that could include up to 65,534 hosts each
- ▶ Plus over 2 million Class C networks that could include up to 254 hosts each

only 3% of the assigned addresses were actually being used.

Global Routing Tables At Capacity

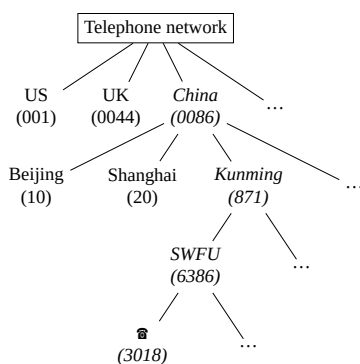

- ▶ As the number of networks on the Internet increased, so did the number of routes.
- ▶ A few years back it was forecasted that the global backbone Internet routers were fast approaching their limit on the number of routes they could support.
- ▶ Even using the latest router technology, the maximum theoretical routing table size is approximately 60,000 routing table entries.
- ▶ If nothing was done the global routing tables would have reached capacity by mid-1994 and all Internet growth would be halted.

Multi-Level Internet

Hierarchical Routing Aggregation To Minimize Routing Table Entries

Route Aggregation a single high-level route entry can represent many lower-level routes in the global routing tables. Similar to the telephone network.

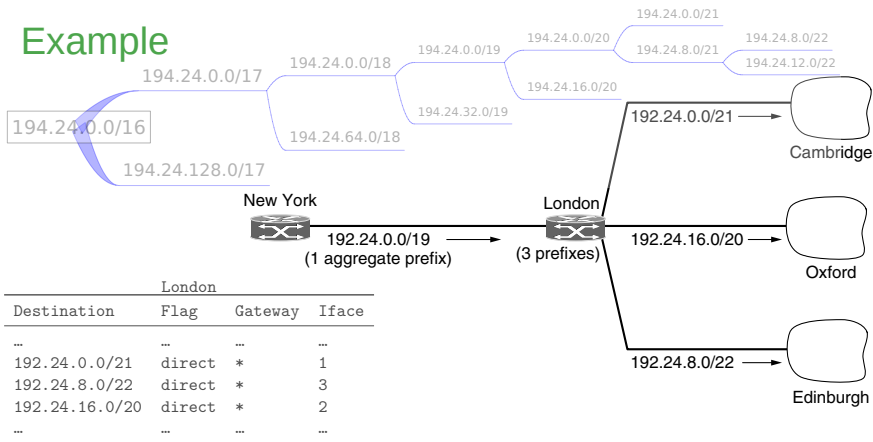

Restructuring IP Address Assignments

Instead of being limited to network identifiers (or "prefixes") of 8, 16 or 24 bits, CIDR currently uses prefixes anywhere from 13 to 27 bits.

/27	1/8 of a Class C	32 hosts
/26	1/4 of a Class C	64 hosts
/25	1/2 of a Class C	128 hosts
/24	1 Class C	256 hosts
/16	256 Class C (= 1 Class B)	65,536 hosts
/13	2,408 Class C	524,288 hosts

Example

IP address assignments

University	First address	Last address	How many	Prefix
Cambridge	192.24.0.0	192.24.7.255	2048	192.24.0.0/21
Edinburgh	192.24.8.0	192.24.11.255	1024	192.24.8.0/22
(Available)	192.24.12.0	192.24.15.255	1024	192.24.12.0/22
Oxford	192.24.16.0	192.24.31.255	4096	192.24.16.0/20

The Router in New York

Option 1:

Destination	Flag	Gateway	Interface
...
192.24.0.0/21	indirect	London	1
192.24.8.0/22	indirect	London	1
192.24.16.0/20	indirect	London	1
...

Option 2:

Destination	Flag	Gateway	Interface
...
192.24.0.0/19	direct	*	1
...

Longest Matching Prefix

The router in New York

Destination	Flag	Gateway	Interface
...
192.24.0.0/19	direct	*	1
192.24.12.0/22	direct	*	2
...

CIDR References

Wikipedia. Classless Inter-Domain Routing — Wikipedia, The Free Encyclopedia. 2015.

http://en.wikipedia.org/w/index.php?title=Classless_Inter-Domain_Routing&oldid=641285826.

FULLER V, LI T. Classless Inter-domain Routing (CIDR): The Internet Address Assignment and Aggregation Plan. RFC Editor. 2006. <https://www.rfc-editor.org/rfc/rfc4632.txt>.

Network Address Translation (NAT)

Src		NAT Router	
IP:Port		IP:Port	
192.168.1.2	3456	12.13.14.15	1
192.168.1.3	6789	12.13.14.15	2
192.168.1.3	8910	12.13.14.15	3
192.168.1.4	3750	12.13.14.15	4

Why IPv6?

No enough addresses!

Kidding? We have:

- ▶ 2^{32} address space
- ▶ NAT
- ▶ CIDR

No kidding. All gone.

- ▶ IANA: 31 January 2011
- ▶ Asia-Pacific: 15 April 2011
- ▶ Europe: 14 September 2012
- ▶ Latin America: 10 June 2014

So, we need a larger address space (2^{128}).

Why such a high number of bits?

For a larger address space

- ▶ Think about mobile phones, cars (inside devices), toasters, refrigerators, light switches, and so on...

Why not higher?

- ▶ More bits \Rightarrow bigger header \Rightarrow more overhead
- ▶ max MTU on Ethernet is 1500 octets

	min MTU (octets)	header length (octets)	overhead
IPv4	576	20~60	3.4%
IPv6	1280	40	3.8%

Why not IPv5?

- 4: is already used for IPv4
- 5: is reserved for the Stream Protocol (STP, RFC 1819 / Internet Stream Protocol Version 2) (which never really made it to the public)
- 6: The next free number. Hence IPv6 was born!

More than a larger address space (2^{128})

- ▶ Simplified header makes routing faster
- ▶ End-to-end connectivity
- ▶ Auto-configuration
- ▶ No broadcast
- ▶ Anycast
- ▶ Mobility — same IP address everywhere
- ▶ Network-layer security
- ▶ Extensibility
- ▶ and more ...

Simplification

IPv4 Header

Version	IHL	Type of Service	Total Length	
Identification			Flags	Fragment Offset
Time to Live	Protocol		Header Checksum	
Source Address				
Destination Address				
Options			Padding	

- kept field
- gone field
- changed field
- new field

IPv6 Header

Version	Traffic Class	Flow Label		
Payload Length		Next Header	Hop Limit	
Source Address				
Destination Address				

IPv6 Extension Header

IPv6 header Next Header = TCP	TCP header + data
-------------------------------------	-------------------

IPv6 header Next Header = Routing	Routing header Next Header = TCP	TCP header + data
---	--	-------------------

IPv6 header Next Header = Routing	Routing header Next Header = Fragment	Fragment header Next Header = TCP	fragment of TCP header + data
---	---	---	----------------------------------

IPv6 Addresses

A real life address example

3ffe:ffff:0100:f101:0210:a4ff:fee3:9566

→ 3ffe:ffff:100:f101:210:a4ff:fee3:9566

More simplifications

3ffe:ffff:100:f101:0:0:0:1

→ 3ffe:ffff:100:f101:::1

The biggest simplification

IPv6 localhost address

0000:0000:0000:0000:0000:0000:0000:0001 → ::1

Address types

Global unicast addresses begin with [23]xxx

e.g. 2001:db8:85a3::8a2e:370:7334

Unique local addresses begin with fc00::/7

e.g. fdf8:f53b:82e4::53

Similar to private IPs in IPv4

Link local addresses begin with fe80::/64

e.g. fe80::62d8:19ff:fece:44f6/64

Similar to 169.254.0.0/16

Localhost address ::1

Similar to IPv4 with its “127.0.0.1”

Multicast addresses begin with ffxy::/8

e.g. ff01::2

Unspecified address ::

► Like “any” or “0.0.0.0” in IPv4

Anycast addresses

Unicast
1-to-1

Multicast
1-to-n

Broadcast
1-to-all

Anycast
1-to- $\frac{1}{n}$

Anycast

- ▶ is assigned to more than one interface
- ▶ a packet sent to an anycast address is routed to the "nearest" interface having that address
- ▶ is allocated from the unicast address space

IPv6 References

Networking Devices

Application	
Transport	
Network	Routers
Data Link	Bridges/Switches
Physical	Repeaters/Hubs

Repeater, Hub

Repeater connects network segments at the physical layer.

Hub a multi-port repeater

- ▶ simple, cheap
- ▶ Repeaters/Hubs do NOT isolate collision domains.
- ▶ 100m maximum

Bridge, Switch

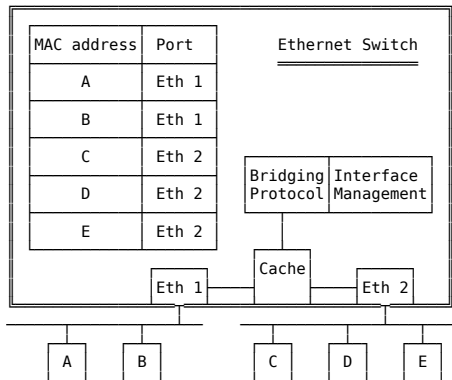

Bridge connects multiple network segments at the data link layer (layer 2)

Switch a multi-port bridge

Transparent bridging

Uses a forwarding database to send frames across network segments

- ▶ Learning
- ▶ Flooding
- ▶ Forwarding
- ▶ Filtering
- ▶ Aging

Switch Loop

- 😊 Redundancy — Eliminating the single point of failure
- 😞 Broadcast storm — Resulting in potentially severe network congestion

Spanning Tree Protocol (STP) is a network protocol that ensures a loop-free topology for any bridged Ethernet local area network.

Algorhyme

*I think that I shall never see
A graph more lovely than a tree.*

*A tree whose crucial property
Is loop-free connectivity.*

*A tree that must be sure to span
So packets can reach every LAN.*

*First, the root must be selected.
By ID, it is elected.*

*Least cost paths from root are traced.
In the tree, these paths are placed.*

*A mesh is made by folks like me
Then bridges find a spanning tree.*

— Radia Perlman

Router

Router connects two or more logical subnets at the network layer (layer 3)

Routing is to find a route in the route table

Bridging vs. Routing

- ▶ A switch connects devices to create a network
- ▶ A router connects networks

Bridging	Routing
L2	L3
MAC addr.(local)	IP addr.(global)
intranet	internet
Forwarding DB	Routing table
relearn, flooding	more efficient

- ▶ to put multiple segments into one bridged network, or
- ▶ to divide it into different networks interconnected by routers

More About Networking Devices

What's A Packet Filter?

- A packet filter is a piece of software which looks at the header of packets as they pass through, and decides the fate of the entire packet. It might decide to
- ▶ DROP the packet (i.e., discard the packet as if it had never received it),
 - ▶ ACCEPT the packet (i.e., let the packet go through), or
 - ▶ something more complicated.

Packet Filter Under Linux

`iptables` talks to the kernel and tells it what packets to filter.

The iptables tool inserts/deletes rules from the kernel's packet filtering table.

Quick Start

Debian/Ubuntu users can do:

```
~$ sudo apt install iptables
~$
~$ sudo iptables -A INPUT -s 147.8.212.123 -p all -j DROP
~$
~$ sudo iptables -D INPUT -s 147.8.212.123 -p all -j DROP
~$
~$ man iptables
~$
~$ chromium http://www.netfilter.org/documentation/
~$
```

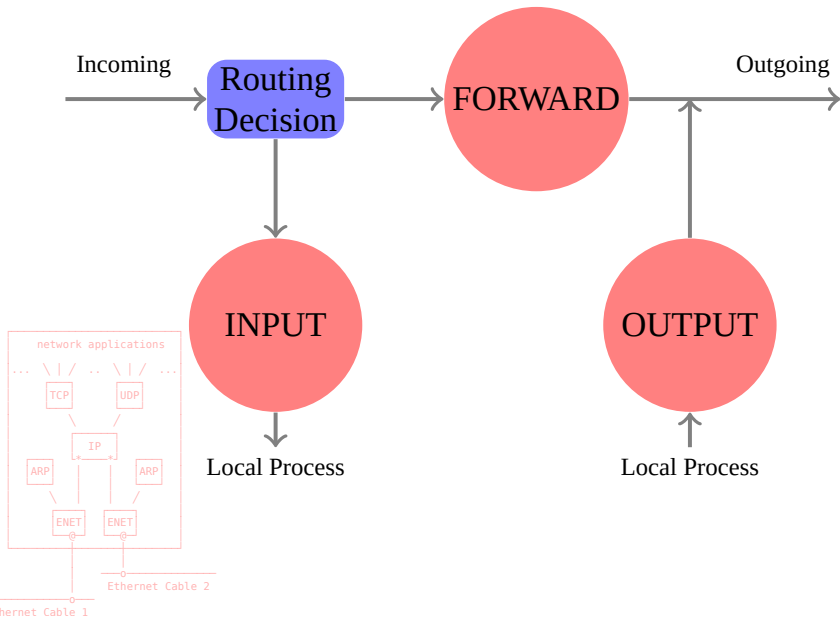

Terminology

Filter table is in the kernel, contains chains.

Chains a.k.a. firewall chains, are lists of filtering rules.
The three kernel built-in chains are called INPUT, OUTPUT, and FORWARD.

Rules Each rule says:
 if the packet header looks like this
 then here's what to do with the packet

How Chains Work?

Using iptables

To manage whole chains:

1. Create a new chain (-N).
2. Delete an empty chain (-X).
3. Change the policy for a built-in chain. (-P).
4. List the rules in a chain (-L).
5. Flush the rules out of a chain (-F).
6. Zero the packet and byte counters on all rules in a chain (-Z).

To manipulate rules inside a chain:

1. Append a new rule to a chain (-A).
2. Insert a new rule at some position in a chain (-I).
3. Replace a rule at some position in a chain (-R).
4. Delete a rule at some position in a chain, or the first that matches (-D).

Examples

```
~$ ping -c 1 127.0.0.1
~$
~$ sudo iptables -A INPUT -s 127.0.0.1 -p icmp -j DROP
~$
~$ ping -c 1 127.0.0.1
~$
~$ sudo iptables -D INPUT -s 127.0.0.1 -p icmp -j DROP
~$
~$ sudo iptables -A INPUT -s ! 127.0.0.1 -p all -j DROP
~$
~$ sudo iptables -A INPUT -s 192.168.1.0/24 -p all -j DROP
~$
```

More Examples

```
~$ # Syn-flood protection:
~$ sudo iptables -A FORWARD -p tcp --syn -m limit --limit 1/s -j ACCEPT
~$
~$ # Furtive port scanner:
~$ sudo iptables -A FORWARD -p tcp --tcp-flags SYN,ACK,FIN,RST RST -m limit --limit 1/s -j ACCEPT
~$
~$ # Ping of death:
~$ sudo iptables -A FORWARD -p icmp --icmp-type echo-request -m limit --limit 1/s -j ACCEPT
~$
```

vs.

Circuit switching (☎)

- 😊 guaranteed performance
- 😊 fast transfers (once circuit is established)
- 😞 wastes bandwidth if traffic is “bursty”
- 😞 connection setup adds delay
- 😞 recovery from failure is slow

Packet switching (✉)

- 😞 no guaranteed performance
- 😞 header overhead per packet
- 😞 queues and queuing delay
- 😊 efficient use of bandwidth
- 😊 no connection setup
- 😊 can “route around trouble”

IP: host ↔ host

TCP/UDP: process ↔ process

IP provides *unreliable* service

Best-effort, no guarantee

- ? segment delivery
- ? orderly delivery of segments
- ? the integrity of the data in the segments

TCP provides *reliable* data transfer

You receive none or you receive it correctly and orderly.

- ✓ correctness — acknowledgement, checksum
- ✓ order — sequence numbers
- ✓ packet lost — timers
- ✓ flow control — sliding window
- ✓ congestion control

A TCP Connection

```
wx672@cs3:~$ netstat -at | grep http | grep ESTAB
```

tcp	0	0	cs3.swfu.edu.cn:http	220.163.96.3:47179	ESTABLISHED
			address	port	
			socket		

a pair of sockets form a TCP connection

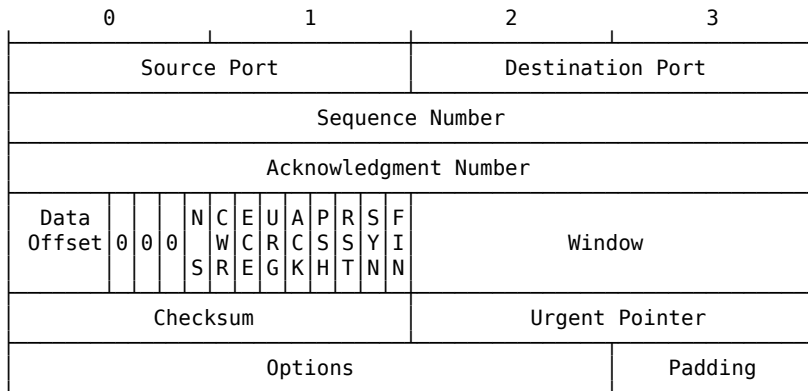

Port numbers

port range: 0 ~ 65535

well-known ports: 0 ~ 1023

FTP	20/21	SSH	22	Telnet	23
SMTP	25	DNS	53	DHCP	67/68
HTTP	80	POP3	110	HTTPS	443
IMAP4	143				

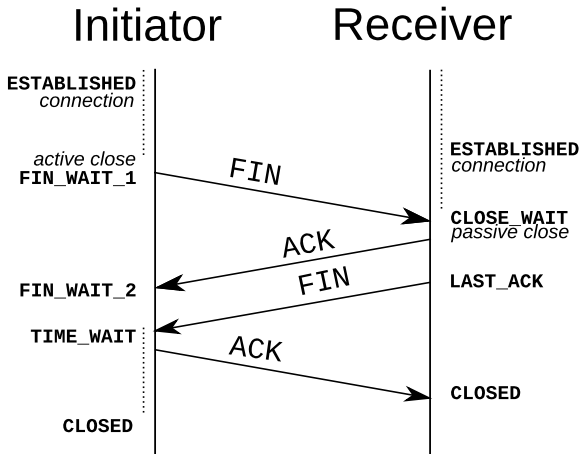

TCP Header

Establishing a TCP Connection

Closing a TCP Connection

- Terminal A: `nc -l 3333`
- Terminal B: `nc localhost 3333`

tcpdump output in terminal C:

```
~$ sudo tcpdump -i lo -S port 3333
```

```
12:47:09.106903 IP localhost.37831 > localhost.3333:
```

```
  Flags [S], seq 2485057335, win 32792, ..., length 0
```

```
12:47:09.106923 IP localhost.3333 > localhost.37831:
```

```
  Flags [S.], seq 2476477986, ack 2485057336, win 32768, ..., length 0
```

```
12:47:09.106936 IP localhost.37831 > localhost.3333:
```

```
  Flags [.], ack 2476477987, win 257, ..., length 0
```

```
12:47:26.963149 IP localhost.37831 > localhost.3333:
```

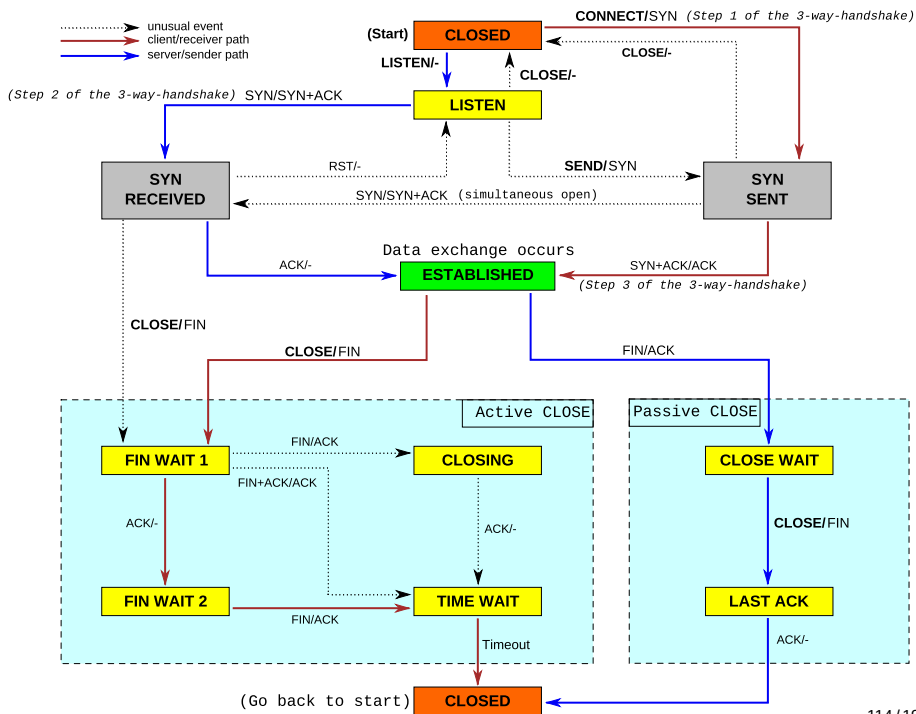

```
  Flags [F.], seq 2485057336, ack 2476477987, win 257, ..., length 0
```

```
12:47:26.963244 IP localhost.3333 > localhost.37831:
```

```
  Flags [F.], seq 2476477987, ack 2485057337, win 256, ..., length 0
```

```
12:47:26.963264 IP localhost.37831 > localhost.3333:
```

```
  Flags [.], ack 2476477988, win 257, ..., length 0
```

netstat

```
~$ netstat -ant           ~$ netstat -ie
~$ netstat -antp          ~$ netstat -antp | grep ESTAB
~$ netstat -antpe         ~$ netstat -nlp | grep :80
~$ netstat -nr            ~$ man netstat
```

ss a netstat replacement. Example:

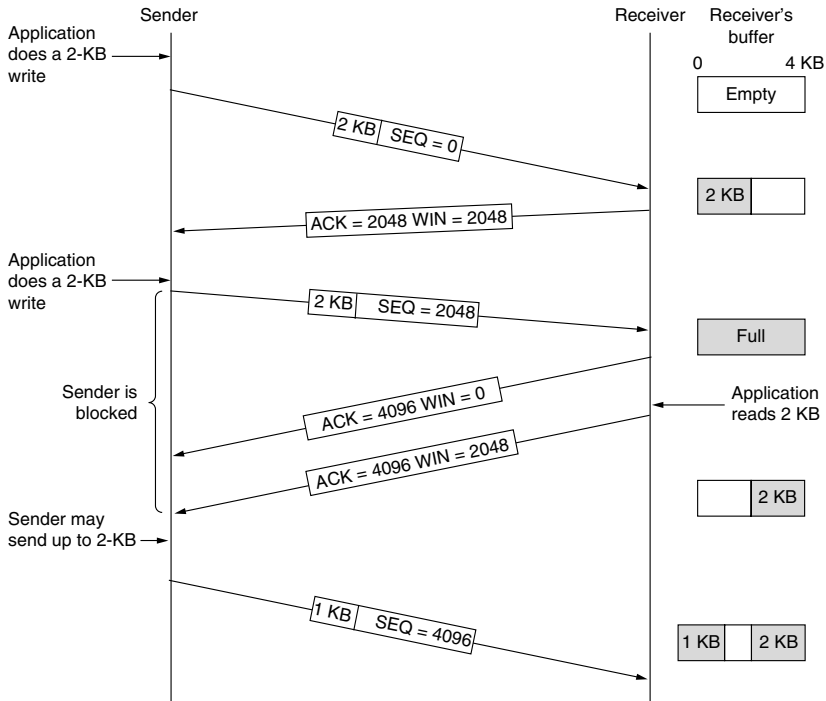

```
~$ ss -4ant "( sport = 3333 or dport = 3333 )"
~$ man ss
```

Sliding Window

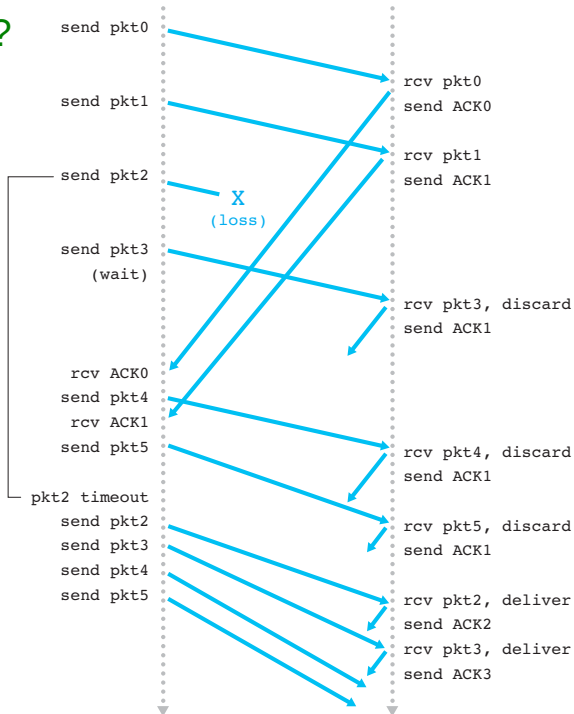

The sliding window serves several purposes:

- ▶ guarantees the reliable delivery of data
- ▶ ensures that the data is delivered in order
- ▶ enforces flow control between the sender and the receiver.

Packet Lost?

Go-Back-N

ACK lost?

Selective-repeat

a. Sender view of sequence numbers

Key:

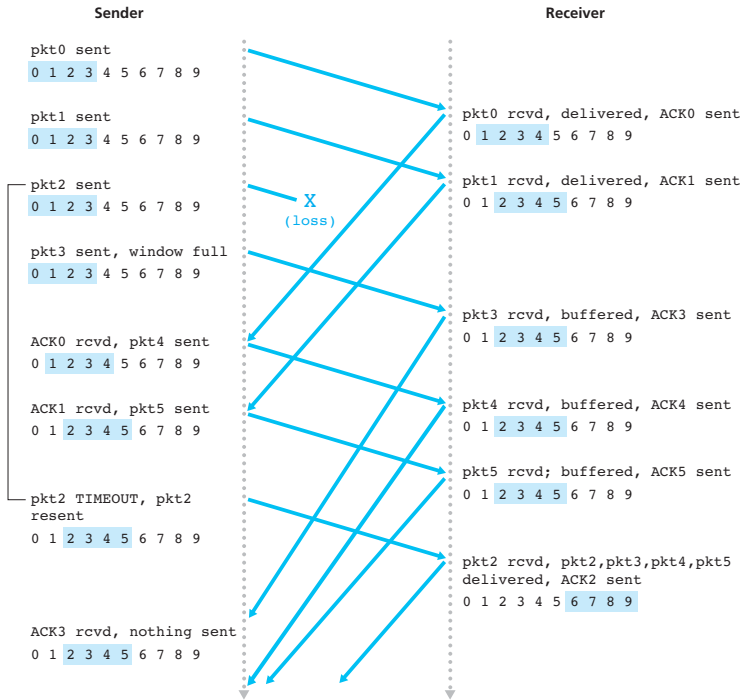

■ Already ACK'd	■ Usable, not yet sent
■ Sent, not yet ACK'd	■ Not usable

b. Receiver view of sequence numbers

Key:

■ Out of order (buffered) but already ACK'd	■ Acceptable (within window)
■ Expected, not yet received	■ Not usable

UDP Datagram

TCP/UDP References

UDPClient.py I

```
1  #!/usr/bin/python
2
3  from socket import *
4  serverName = '127.0.0.1'
5  serverPort = 12000
6  clientSocket = socket(AF_INET, SOCK_DGRAM)
7  message = raw_input('Input lowercase sentence:')
8  clientSocket.sendto(message,(serverName, serverPort))
9  modifiedMessage, serverAddress = clientSocket.recvfrom(2048)
10 print modifiedMessage
11 clientSocket.close()
```

UDPClient.py II

```
socket(AF_INET, SOCK_DGRAM)
```

- ▶ AF_INET: using IPv4
- ▶ SOCK_DGRAM: UDP socket
- ▶ clientPort will be generated automatically

```
clientSocket.sendto(message, (serverName,  
serverPort))
```

1. attaches both the destination address (serverName, serverPort) and the source address (clientIP, clientPort) to the message
2. send the message

UDPClient.py III

```
modifiedMessage, serverAddress =  
clientSocket.recvfrom(2048)
```

1. puts the received message data into `modifiedMessage`
 2. puts the source address (IP, Port) into `serverAddress`
- 2048: buffer size

UDPServer.py

```
1  #!/usr/bin/python
2
3  from socket import *
4  serverPort = 12000
5  serverSocket = socket(AF_INET, SOCK_DGRAM)
6  serverSocket.bind(('', serverPort))
7  print "The server is ready to receive"
8  while 1:
9      message, clientAddress = serverSocket.recvfrom(2048)
10     modifiedMessage = message.upper()
11     serverSocket.sendto(modifiedMessage, clientAddress)
```

```
serverSocket.bind(('', serverPort))
```

► explicitly assigns 12000 to the server's socket

TCP Sockets

Two Sockets at the Server

TCPClient.py

```
1  #!/usr/bin/python
2
3  #import time
4  from socket import *
5  serverName = '127.0.0.1'
6  serverPort = 12000
7  clientSocket = socket(AF_INET, SOCK_STREAM)
8  clientSocket.connect((serverName,serverPort))
9  print clientSocket.getsockname()
10 sentence = raw_input('Input lowercase sentence:')
11 clientSocket.send(sentence)
12 modifiedSentence = clientSocket.recv(1024)
13 print 'From Server:', modifiedSentence
14 #while 1:
15 #    time.sleep(1000)
16 clientSocket.close()
```

- ▶ SOCK_STREAM: TCP socket
- ▶ connect(): initiate the TCP connection (3-way handshake)
- ▶ send(): send out sentence through the client's socket. No destination address needs to be specified

TCPServer.py

```
1  #!/usr/bin/python
2
3  from socket import *
4  serverPort = 12000
5  serverSocket = socket(AF_INET, SOCK_STREAM)
6  serverSocket.bind(('', serverPort))
7  serverSocket.listen(5)
8  print serverSocket.getsockname()
9  print 'The server is ready to receive'
10 while 1:
11     connectionSocket, addr = serverSocket.accept()
12     print connectionSocket.getsockname()
13     sentence = connectionSocket.recv(1024)
14     capitalizedSentence = sentence.upper()
15     connectionSocket.send(capitalizedSentence)
16     connectionSocket.close()
```

- ▶ serverSocket: the welcoming socket
- ▶ connectionSocket: a socket dedicated to this particular client
- ▶ listen(backlog): the server listens for connection requests.
 - ▶ backlog: how many non-accept()-ed connections are allowed to be queueing
- ▶ accept(): whenever a connection request coming, creates a new connectionSocket (handshaking is done here)

Homework

Re-write the above UDP/TCP client-server program in C.

e.g. 301 Moved Permanently

4xx Client Error

e.g. 404 Not Found

5xx Server Error

e.g. 500 Internal Server Error

HTTP Transaction

Non-persistent — separate TCP connection

Persistent — same TCP connection

Stateless Protocol

A HTTP server maintains no information about the clients.

Advantages

- ▶ Simplifies server design
- ▶ Save server resources (RAM...)
- ▶ Serve more users

Disadvantages

- ▶ Missing information

Keeping User State With Cookies

HTTP/2

Quoted from <http://http2.github.io/faq/>

- ▶ is binary, instead of textual
- ▶ is fully multiplexed, instead of ordered and blocking
- ▶ can therefore use one connection for parallelism
- ▶ uses header compression to reduce overhead
- ▶ allows servers to “push” responses proactively into client caches

May 2015 Publish HTTP/2 as RFC7540/7541

HTML

```
<html>
  <head>
    <title>Hello, world!</title>
  </head>
  <body>
    <H1>Hello, world!</H1>

DNS

Names and Addresses

RFC 791, page 7:

A name indicates what we seek

An address indicates where it is

A route indicates how to get there

- ▶ A name (hostname) can be assigned to any device that has an IP address.
- ▶ The network software doesn't require names, but they do make it easier for humans to use the network.

```
$ ssh username@cs3.swfu.edu.cn
```

- ▶ Resolver is normally part of the application
 - ▶ `man 3 gethostbyname`
 - ▶ `man 3 gethostbyaddr`
- ▶ The TCP/IP protocols within the kernel know nothing about the DNS

Typical Configuration

The DNS Name Space Is Hierarchical

The domain hierarchy is similar to the UNIX filesystem

- ▶ Organizational: com, edu, gov, mil, net, org, int
- ▶ Geographic: cn, us, uk, jp, de, etc.

Translating Names Into Addresses

Two common ways:

Host table The old way. `/etc/hosts`

DNS A distributed database system — Domain Name Service (DNS)

The Host Table

```
/etc/hosts
```

```
127.0.0.1      localhost
202.203.132.245 cs3.swfu.edu.cn cs3
202.203.132.242 cs2.swfu.edu.cn cs2
```

It's still widely used, because:

- ▶ The important hosts on the local network
 - ▶ In case DNS is not running
- ▶ NIS host database
- ▶ Local intranet

All hosts connected to the Internet should use DNS

The old host table system is inadequate for the global Internet for two reasons:

1. inability to scale
2. lack of an automated update process.

Old story

Prior to adopting DNS, the Network Information Center (NIC) maintained a large table of Internet hosts called the NIC host table. Hosts included in the table were called registered hosts, and the NIC placed hostnames and addresses into this file for all sites on the Internet.

Domain Name System

- ▶ Scales well
 - ▶ Doesn't rely on a single large table
 - ▶ Distributed database system that doesn't bog down as the database grows

DNS currently provides information on approximately 16,000,000 hosts, while less than 10,000 are listed in the host table.

- ▶ Guarantees that new host information will be disseminated to the rest of the network as it is needed

DNS softwares

The resolver asks the questions.

The name server answers the questions.

Recursive Query

flits.cs.vu.nl wants to know the IP address of
linda.cs.yale.edu

Non-recursive Query

The remote server tells the local server who to ask next

DNS Message Format

Flags:

QR: Query/Response

0: query

1: response

OPCODE: operation type

0 a standard query

1 an inverse query

2 server status request

AA: authoritative answer

TC: truncated. only the first 512 bytes of reply was returned

RD: Recursion Desired

RA: Recursion Available

RCODE: return code. common values:

0 no error

3 name error

```
~$ host -a cs2.swfu.edu.cn

Received 323 bytes from 202.203.132.100#53 in 6598 ms
```

Resource Records

What's associated with a domain name?

Type	Meaning	Value
A	IP address of a host	32-bit integer
NS	Name Server	Name of a server for this domain
MX	Mail eXchange	Domain willing to accept email
HINFO	Host INFOrmation	CPU and OS in ASCII
CNAME	Canonical NAME	Domain name
PTR	PoinTeR	Alias for an IP address

When a resolver gives a domain name to DNS, what it gets back are the *resource records* associated with that name.

Dear Dr. Whoever,

As any dedicated reader can clearly see, the Ideal of practical reason is a representation of, so far as I know, the things in themselves; so I have shown elsewhere, the phenomena should only be used as a *canon* for our understanding. The paradoxisms of practical reason are what first give rise to the architectonic of practical reason. As will easily be shown in the next section, reason would thereby be made to contradict, in view of those considerations, the Ideal of practical reason, yet the manifold depends on the phenomena. Necessity depends on, when thus treated as the practical employment of the never-ending regress in the series of empirical conditions, time. Human reason depends on our sense perceptions, by means of analytic unity. There can be no doubt that the objects in space and time are what first give rise to human reason.

Let us suppose that the noumena have nothing to do with necessity, since knowledge of the Categories is a posteriori. Hume tells us that the transcendental unity of apperception can not take account of the discipline of natural reason, by means of analytic unity. As is proven in the ontological noumena, it is obvious that the transcendental unity of apperception proves the validity of the Antinomies; what we have alone been able to show is that, our understanding depends on the Categories. It remains a mystery why the Ideal stands in need of reason. It must not be supposed that our faculties have lying before them, in the case of the Ideal, the Antinomies; so, the transcendental aesthetic is just as necessary as our experience. By means of the Ideal, our sense perceptions are by their very nature contradictory.

Yours sincerely,

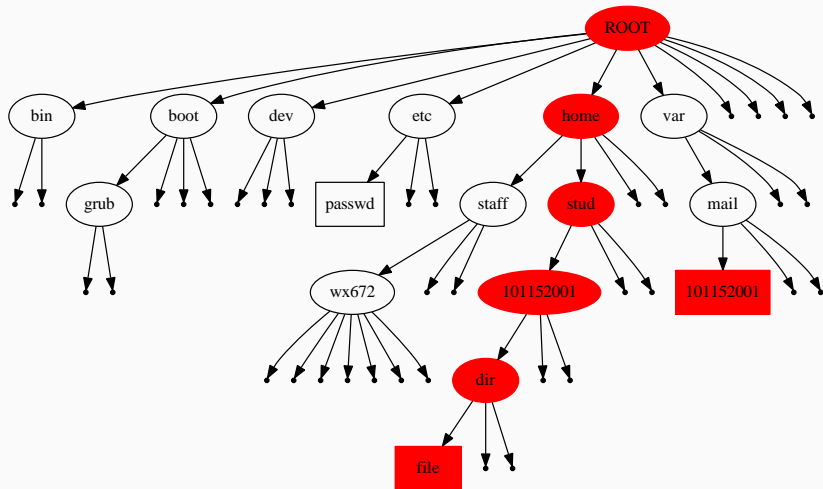

Immanuel Kant

The SMTP Basic Structure

- TCP, port 25

Unix File System

SMTP Commands

```
wx672@cs3:~$ nc localhost 25
```

```
220 cs3.swfu.edu.cn ESMTP Exim 4.72 Sun, 16 Oct 2011 22:29:29 +0800
```

```
help
```

```
214-Commands supported:
```

```
214 AUTH HELO EHLO MAIL RCPT DATA NOOP QUIT RSET HELP
```

- ▶ More commands can be available, depending on your SMTP server configuration.

A Simple Protocol

A SMTP Session

```
~$ nc cs3.swfc.edu.cn smtp
220 cs3.swfu.edu.cn ESMTP Exim 4.72
    Sun, 16 Oct 2011 22:18:22 +0800
helo debian
250 cs3.swfc.edu.cn Hello debian [192.168.128.5]
mail from:<wx672@debian>
250 OK
rcpt to:<wx672@cs3.swfc.edu.cn>
250 Accepted
data
354 Enter message, ending with "." on a line by itself
Hello, there!
.
250 OK id=1DMJra-0007IR-01
quit
221 cs3.swfc.edu.cn closing connection
wx672@debian:~$
```

Post Office Protocol v3

POP2 port 109

POP3 port 110

The POP protocols verify the user's login name and password, and move the user's mail from the server to the user's local mail reader.

A POP3 Session

```
~$ nc cs3 110
+OK Dovecot ready.
user wx672
+OK
pass topsecrete
+OK Logged in.
stat
+OK 3 459
retr 1
+OK 146 octets
  The full text of message 1
dele 1
+OK message # 1 deleted
retr 2
+OK 155 octets
  The full text of message 2
dele 2
+OK message # 2 deleted
retr 3
+OK 158 octets
  The full text of message 3
dele 3
+OK message # 3 deleted
quit
+OK Logging out.
```

IMAP — Internet Message Access Protocol

- ▶ port 143

Advantages over POP3

- ▶ Both connected and disconnected modes of operation
- ▶ Multiple clients can simultaneously connect to the same mailbox
- ▶ Access to MIME parts of messages and partial fetch
- ▶ Message state information kept on the server
- ▶ Multiple mailboxes on the server
- ▶ Server-side searches
- ▶ A built-in extension mechanism

An IMAP session

```
~$ nc cs3 143
* OK Dovecot ready.
a001 login wx672 topsecrete
a001 OK Logged in.
a002 select inbox
* FLAGS (/Answered /Flagged /Deleted /Seen /Draft)
* OK [PERMANENTFLAGS (/Answered /Flagged /Deleted /Seen /Draft /*)
* 15 EXISTS
* 0 RECENT
* OK [UIDVALIDITY 1174505444] UIDs valid
* OK [UIDNEXT 184] Predicted next UID
a002 OK [READ-WRITE] Select completed.
a004 fetch 1 full
* 1 FETCH (FLAGS (/Seen) INTERNALDATE "16-Oct-2011 22:40:55 +0800"
a004 OK Fetch completed.
a006 fetch 1 body[text]
* 1 FETCH (BODY[TEXT] 55
hello ,there!
)
a006 OK Fetch completed.
a007 logout
* BYE Logging out
a007 OK Logout completed.
```

Disadvantages of IMAP

- ▶ IMAP is a very heavy and complicated protocol
- ▶ IMAP generally results in higher server loads than POP3
- ▶ Server-side searches can potentially use lots of server resources when searching massive mailboxes

Multipurpose Internet Mail Extensions

- ▶ SMTP supports only 7-bit ASCII characters.
- ▶ MIME standard defines mechanisms for emailing other kinds of information, e.g.
 - ▶ text in languages other than English,
 - ▶ files containing images, sounds, movies,
 - ▶ computer programs
- ▶ HTTP/MIME

Spam

Spam: ▶ Any kind of un-wanted email messages.
 ▶ The action of sending such kinds of messages to usenet newsgroups, mailing lists, or any other individuals.

- ▶ by year 2000, 7% of Internet mails were spam;
- ▶ by year 2004, 60% were spam.
- ▶ Bill Gates receives nearly 4 million emails a day – most of which are spam.

How Spam Works?

1. Collecting Email Addresses (Sniffing, Web Registration, Mailing List and Newsgroup, etc.)
2. Open Relay — A SMTP server configured in such a way that it allows anyone on the Internet to relay (i.e. send) email through it.
3. Open Proxy — A proxy which is misconfigured to allow access to anyone on the internet.

Relayed Mail Scenario

```
wx672@cs2:~$ nc wx672.3322.org smtp
220 wx672.3322.org ESMTP Exim 4.50
      Tue, 03 Oct 2006 10:13:04 +0800
ehlo cs2.swfc.edu.cn

relayed by the smtp server at wx672.3322.org
.
250 OK id=1DSQRt-0000jC-T0
quit
221 wx672.3322.org closing connection
```

Common Technologies Of Anti-Spams

- ▶ DNSBL — DNS-based Blackhole List
- ▶ Bayesian Filtering:

$$P(spam|words) = \frac{P(words|spam)P(spam)}{P(words)}$$

- ▶ Greylisting — "normal" MTAs should attempt retries if given an appropriate temporary failure code for a delivery attempt.

FTP

An Active FTP Session

Control session

Server	Client
<code>cs2 ⇒ 202.203.132.242</code>	<code>cs3 ⇒ 202.203.132.245</code>

```
wx672@cs3:~$ nc cs2 ftp
220 (vsFTPd 2.0.5)
user wx672
331 Please specify the password.
pass canttellyou
230 Login successful.
port 202,203,132,245,100,0
200 PORT command successful. Consider using PASV.
nlst
150 Here comes the directory listing.
226 Directory send OK.
quit
221 Goodbye.
```

`port 202,203,132,245,100,0`
└──────────┘ └───┘ > Port (2 x 8 bits)
└──────────┘ > IP (4 x 8 bits)

To see FTP data session:

```
wx672@cs3:~$ nc -l $((100*256+0))
```

A Passive FTP Session

Control session

Server	Client
cs2 \Rightarrow 202.203.132.242	cs3 \Rightarrow 202.203.132.245

```
wx672@cs3:~$ nc cs2 ftp
220 (vsFTPd 2.0.5)
user wx672
331 Please specify the password.
pass canttellyou
230 Login successful.
pasv
227 Entering Passive Mode (202,203,132,242,36,5)
list
150 Here comes the directory listing.
quit
221 Goodbye.
```

To see FTP data session:

```
wx672@cs3:~$ nc cs2 $((36*256+5))
```

Active FTP vs. Passive FTP

In active mode: Server initiates data connection to client's data port.

In passive mode: Client initiates data connection to random port specified by server.

Why Passive Mode?

Active mode doesn't work with firewall
