What's A Computer Network?

The History of Internet I

1836:	Telegraph
1858-66:	Transatlantic cable
1876:	Telephone
1957:	USSR launches Sputnik
1962-68:	Packet-switching networks developed
1969:	Birth of Internet
1971:	People communicate over a network
1972:	Computers can connect more freely and easily
1973:	Global Networking becomes a reality
1974:	Packets become mode of transfer

The History of Internet II

1976: Networking comes to many 1977: E-mail takes off, Internet becomes a reality 1979: News Groups born 1981: Things start to come together 1982: TCP/IP defines future communication 1983: Internet gets bigger 1984: Growth of Internet Continues 1986: Power of Internet Realised 1987: Commercialisation of Internet Born 1989: Large growth in Internet 1990: Expansion of Internet continues

The History of Internet III

1991: Modernisation Begins

1992: Multimedia changes the face of the Internet

1993: The WWW Revolution truly begins

1994: Commercialisation begins

1995: Commercialisation continues apace

1996: Microsoft enters

1998: Google

Homework: Meanwhile, what happened in China?

What pops up in your mind if I say "Internet"?

What pops up in your mind if I say "Internet"?

For me, the answer is...

and...

What pops up in your mind if I say "Internet"?

For me, the answer is...

and...

TCP/IP

- ► The network of networks.
- ► Tech view: TCP/IP
- ► App view: Google

Google Philosophy

Ten things Google has found to be true

- Focus on the user and all else will follow.
- 2. It's best to do one thing really, really well.
- 3. Fast is better than slow.
- 4. Democracy on the web works.
- 5. You don't need to be at your desk to need an answer.
- 6. You can make money without doing evil.
- 7. There's always more information out there.
- The need for information crosses all borders.
- 9. You can be serious without a suit.
- 10. Great just isn't good enough.

Google Philosophy

- ► Software Principles
- ► Google User Experience
- ▶ No pop-ups
- Security

Google Products

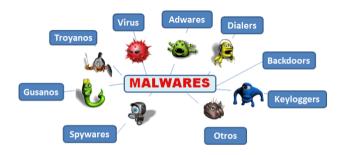

Choosing The Right Tools

Dangerous

Dangerous

My solution

Homework

- 1. try 🗘
- 2. get a gmail account
- 3. add your class timetable into google calendar, and then share your calendar to me via gmail
- 4. in youtube, find a video you like and share it to me

Network Classification

- connection method: wired, wireless...
- topology
- scale
- network architecture: c/s, p2p...

Network Classification

ARP

ARP Looking up the ARP table to find the destination MAC address.

Example ARP table

Ethernet address
08-00-39-00-2F-C3
08-00-5A-21-A7-22
08-00-10-99-AC-54

Where does the ARP table come from?

Example ARP Request

Sender IP Address	223.1.2.1
Sender Eth Address	08-00-39-00-2F-C3
Target IP Address	223.1.2.2
Target Eth Address	FF-FF-FF-FF-FF

Example ARP Response

Sender IP Address	223.1.2.2
Sender Eth Address	08-00-28-00-38-A9
Target IP Address	223.1.2.1
Target Eth Address	08-00-39-00-2F-C3

The updated table

IP address	Ethernet address
223.1.2.1	08-00-39-00-2F-C3
223.1.2.2	08-00-28-00-38-A9
223.1.2.3	08-00-5A-21-A7-22
223.1.2.4	08-00-10-99-AC-54

Routing Find a route in the route table.

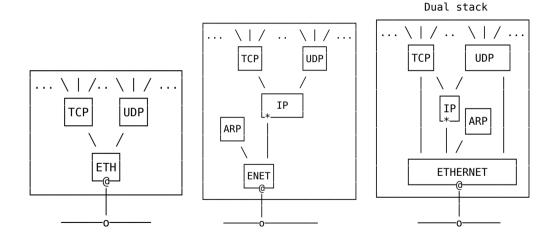

Direct Routing—IP is overhead

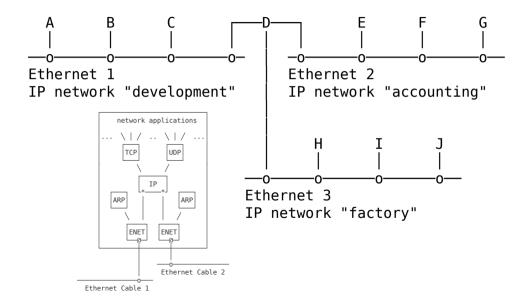

Addresses in an Ethernet frame for an IP packet from A to B

address	source	destination
IP	Α	В
Eth	Α	В

Is IP Necessary?

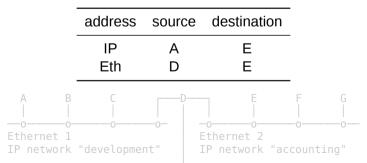

Indirect Routing

Addresses in an Ethernet frame for an IP packet from A to E (before D)

address	source	destination
IP	Α	E
Eth	Α	D

Addresses in an Ethernet frame for an IP packet from A to E (after D)

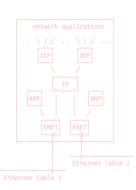

IP Module Routing Rules

- For an outgoing IP packet, entering IP from an upper layer, IP must decide
 - whether to send the IP packet directly or indirectly, and
 - IP must choose a lower network interface.

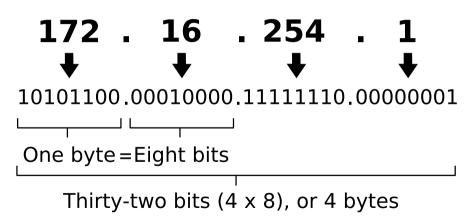

These choices are made by consulting the route table.

- 2. For an incoming IP packet, entering IP from a lower interface, IP must decide
 - whether to forward the IP packet or pass it to an upper layer.
 - If the IP packet is being forwarded, it is treated as an outgoing IP packet.
- 3. When an incoming IP packet arrives it is never forwarded back out through the same network interface.

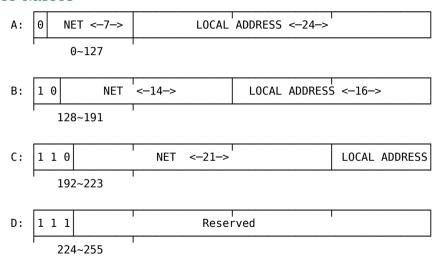

IP Address

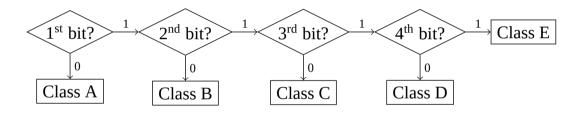

An IPv4 address (dotted-decimal notation)

Address classes

Prefix

Special IP Addresses

- A value of zero in the network field means this network. (source only)
- ► A value of zero in the host field means network address.
- ► 127.x.x.x are loopback address.
- 255.255.255.255 is boardcast address.
- Private address:
 - ▶ 10.x.x.x
 - ightharpoonup 172.16.x.x \sim 172.31.x.x
 - ▶ 192.168.x.x
- ► CIDR—Classless Inter-Domain Routing—An IP addressing scheme that replaces the older system based on classes A, B and C.

Names

People refer to computers by names, not numbers.

/etc/hosts

127.0.0.1 localhost

202.203.132.245 cs3.swfu.edu.cn cs3

/etc/networks

localnet 202.203.132.192

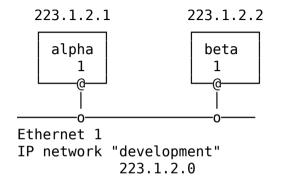

IP Route Table

Example IP Route Table

```
~$ route
Kernel IP routing table
Destination Gateway Iface
localnet * eth0
192.168.128.0 * eth0
default 202.203.132.254 eth0
```

~\$ man route

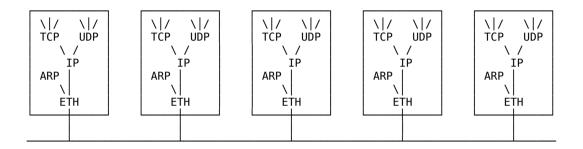

Direct Routing Details

The route table inside alpha (simplified)

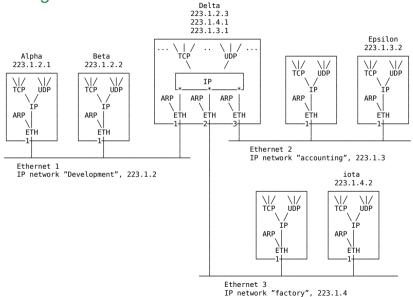

network	flag	router	interface
development	direct		1

Homework

Alpha is sending an IP packet to beta...Please describe.

Indirect Routing Details

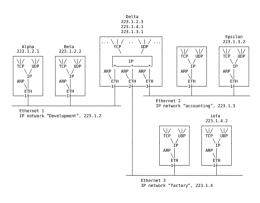

Indirect Routing Details

The route table inside alpha

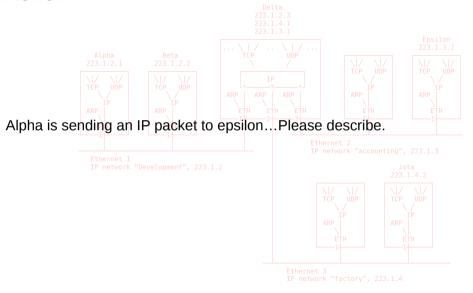

network	flag	router	interface
223.1.2	direct		1
223.1.3	indirect	223.1.2.4	1
223.1.4	indirect	223.1.2.4	1

The route table inside delta

network	flag	router	interface
223.1.2	direct		1
223.1.3	direct		3
223.1.4	direct		2

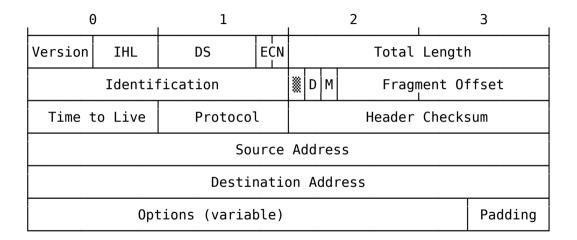

Homework

Managing The Routes

- Manually maintained by administrator
- ICMP can report some routing problems
- ► For larger networks, routing protocols are used.

IP Packet

Why Subnetting?

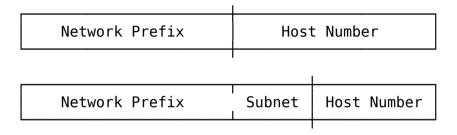

- save address space
- restrict collision domain
- security
- physical media (Ethernet, FDDI, ...)

-254

How

Subnet mask is a bitmask used to identify the network and node parts of the address.

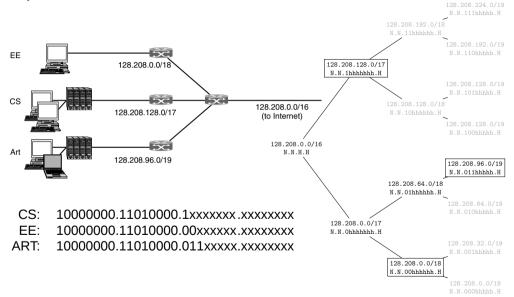

Default Subnet Masks

Class A 255.0.0.0 111111111.0.0.0

Class B 255.255.0.0 111111111.11111111.0.0

Class C 255.255.255.0 111111111.11111111.0

Example

$2^{n} - 2$

Example

- ▶ There are $2^2 2 = 2$ subnets
- ▶ Each subnet has $2^6 2 = 62$ nodes
- Subtract 2? All "0"s and all "1"s. (old story)

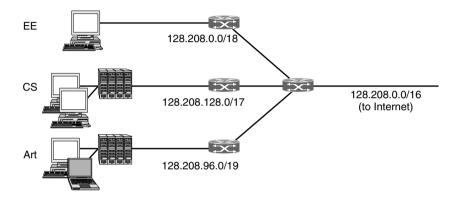

Subnet Calculator

free IP subnet calculators

Try:

- ~\$ subnetcalc 202.203.132.244/26
- ~\$ ipcalc 202.203.132.244/26
- ~\$ sipcalc 202.203.132.244/26

Quiz

Consider a packet addressing 128.208.2.251

Q1: Which subnet it belongs to?

Q2: The route table inside each router?

CIDR—Classless Inter-Domain Routing

CIDR An IP addressing scheme that replaces the older system based on classes A, B and C.

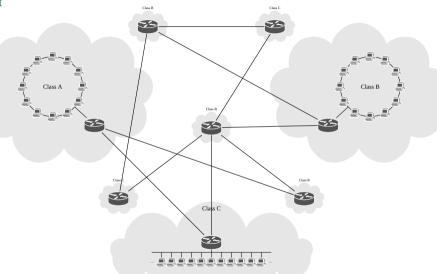

Why?

With a new network being connected to the Internet every 30 minutes the Internet was faced with two critical problems:

- Running out of IP addresses
- Running out of capacity in the global routing tables

Two-Level Internet

Network – Host

Running out of IP addresses

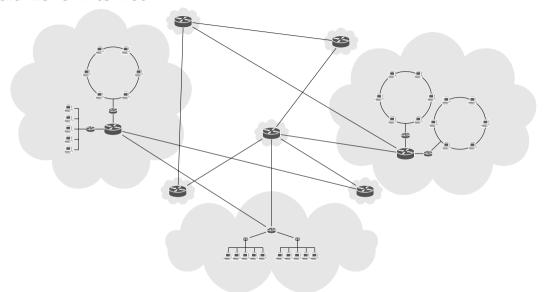

Using the old addressing scheme, the Internet could support:

- ▶ 126 Class A networks that could include up to 16,777,214 hosts each
- ▶ Plus 65,000 Class B networks that could include up to 65,534 hosts each
- ▶ Plus over 2 million Class C networks that could include up to 254 hosts each only 3% of the assigned addresses were actually being used.

Global Routing Tables At Capacity

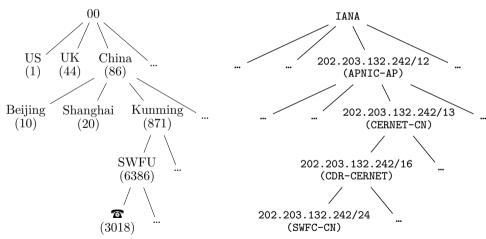

- ► As the number of networks on the Internet increased, so did the number of routes.
- A few years back it was forecasted that the global backbone Internet routers were fast approaching their limit on the number of routes they could support.
- ► Even using the latest router technology, the maximum theoretical routing table size is approximately 60,000 routing table entries.
- ► If nothing was done the global routing tables would have reached capacity by mid-1994 and all Internet growth would be halted.

Multi-Level Internet

Hierarchical Routing Aggregation To Minimize Routing Table Entries

Route Aggregation a single high-level route entry can represent many lower-level routes in the global routing tables. Similar to the telephone network.

Restructuring IP Address Assignments

Instead of being limited to network identifiers (or "prefixes") of 8, 16 or 24 bits, CIDR currently uses prefixes anywhere from 13 to 27 bits.

/27	1/8 of a Class C	32 hosts
/26	1/4 of a Class C	64 hosts
/25	1/2 of a Class C	128 hosts
/24	1 Class C	256 hosts
/16	256 Class C	65,536 hosts
	(= 1 Class B)	
/13	2,408 Class C	524,288 hosts

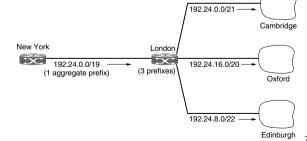

194.24.0.0/19—194.24.0.0/19—194.24.16.0/20—194.24.0.0/16—194.24.128.0/17—194.24.18.0/194.0/194.24.18.0/194.0/194.24.18.0/194.0

IP address assignments

	University	First address	Last address	How many	Prefix

The router in New York

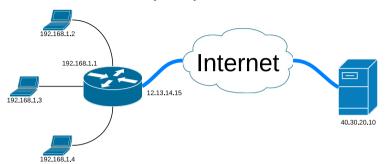

Destination	Flag	Gateway	Interface
 192.24.0.0/19 192.24.12.0/22		 * *	 1 2
		•••	•••

CIDR References

Network Address Translation (NAT)

Src	NAT Router
IP:Port	IP:Port
192.168.1.2:3456	12.13.14.15:1
192.168.1.3:6789	12.13.14.15:2
192.168.1.3:8910 192.168.1.4:3750	12.13.14.15:3 12.13.14.15:4

Why IPv6?

No enough addresses!

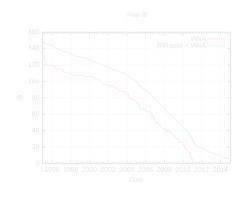

Kidding? We have:

- $ightharpoonup 2^{32}$ address space
- ► NAT
- ► CIDR

No kidding. All gone.

- ► IANA: 31 January 2011
- Asia-Pacific: 15 April 2011
- Europe: 14 September 2012
- Latin America: 10 June 2014

So, we need a larger address space (2^{128}) .

Why such a high number of bits?

For a larger address space

► Think about mobile phones, cars (inside devices), toasters, refrigerators, light switches, and so on...

Why not higher?

- More bits ** bigger header ** more overhead
- max MTU on Ethernet is 1500 octets

	min MTU (octets)	header length (octets)	overhead
IPv4	576	20~60	3.4%
IPv6	1280	40	3.8%

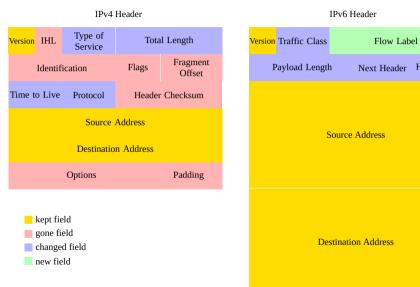

Why not IPv5?

- 4: is already used for IPv4
- 5: is reserved for the Stream Protocol (STP, RFC 1819 / Internet Stream Protocol Version 2) (which never really made it to the public)
- 6: The next free number. Hence IPv6 was born!

More than a larger address space (2^{128})

- Simplified header makes routing faster
- End-to-end connectivity
- Auto-configuration
- No broadcast
- Anycast
- Mobility same IP address everywhere
- Network-layer security
- Extensibility
- and more ...

Simplification

Hop Limit

IPv6 Extension Header

IPv6 Addresses

A real life address example

```
3ffe:ffff:0100:f101:0210:a4ff:fee3:9566

3ffe:ffff:100:f101:210:a4ff:fee3:9566
```

More simplifications

```
3ffe:ffff:100:f101:0:0:0:1

3ffe:ffff:100:f101::1
```

The biggest simplification

IPv6 localhost address

```
0000:0000:0000:0000:0000:0000:0001 ** ::
```

Address types

Global unicast addresses begin with [23] xxx

e.g. 2001:db8:85a3::8a2e:370:7334

Unique local addresses begin with fc00::/7

e.g. fdf8:f53b:82e4::53

Similiar to private IPs in IPv4

Link local addresses begin with fe80::/64

e.g. fe80::62d8:19ff:fece:44f6/64

Similiar to 169.254.0.0/16

Localhost address ::1

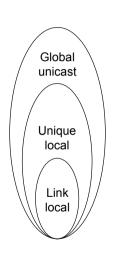

Similiar to IPv4 with its "127.0.0.1"

Multicast addresses begin with ffxy::/8

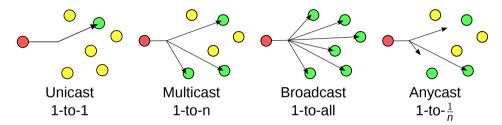

e.g. ff01::2

Unspecified address ::

► Like "any" or "0.0.0.0" in IPv4

Anycast addresses

Anycast

- is assigned to more than one interface
- a packet sent to an anycast address is routed to the "nearest" interface having that address
- is allocated from the unicast address space

Networking Devices

Application Transport Network Routers Data Link Bridges/Switches **Physical** Repeaters/Hubs

Repeater, Hub

Repeater connects network segments at the physical layer.

Hub a multi-port repeater

- simple, cheap
- Repeaters/Hubs do NOT isolate collision domains.
- ► 100m maximum

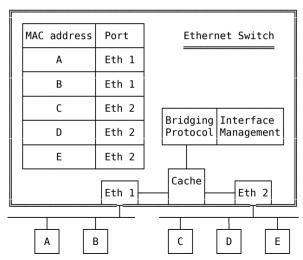

Bridge, Switch

Bridge connects multiple network segments at the data link layer (layer 2) Switch a multi-port bridge

Transparent bridging

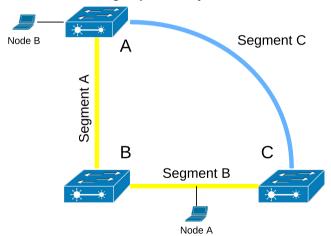

Uses a forwarding database to send frames across network segments

- Learning
- Flooding
- Forwarding
- Filtering
- Aging

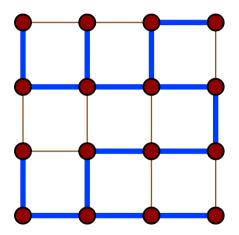

Switch Loop

- © Redundancy Eliminating the single point of failure
- Broadcast storm Resulting in potentially severe network congestion

Spanning Tree Protocol (STP) is a network protocol that ensures a loop-free topology for any bridged Ethernet local area network.

Algorhyme

I think that I shall never see A graph more lovely than a tree.

A tree whose crucial property Is loop-free connectivity.

A tree that must be sure to span So packets can reach every LAN.

First, the root must be selected. By ID, it is elected.

Least cost paths from root are traced. In the tree, these paths are placed.

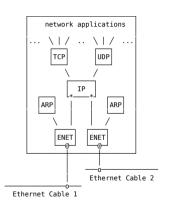

A mesh is made by folks like me Then bridges find a spanning tree.

Router

Router connects two or more logical subnets at the network layer (layer 3)

Routing is to find a route in the route table

Bridging vs. Routing

- A switch connects devices to create a network
- A router connects networks

Bridging	Routing
L2	L3
MAC addr.(local)	IP addr.(global)
intranet	internet
Forwarding DB	Routing table
relearn, flooding	more efficient

- to put multiple segments into one bridged network, or
- to divide it into different networks interconnected by routers

What's A Packet Filter?

A packet filter is a piece of software which looks at the header of packets as they pass through, and decides the fate of the entire packet. It might decide to

- DROP the packet (i.e., discard the packet as if it had never received it),
- ACCEPT the packet (i.e., let the packet go through), or
- something more complicated.

Packet Filter Under Linux

iptables talks to the kernel and tells it what packets to filter.

The iptables tool inserts/deletes rules from the kernel's packet filtering table.

Quick Start

Debian/Ubuntu users can do:

```
~$ sudo apt install iptables
~$
~$ sudo iptables -A INPUT -s 147.8.212.123 -p all -j DROP
~$
  sudo iptables -D INPUT -s 147.8.212.123 -p all -j DROP
~$
~$ man iptables
~$
  chromium http://www.netfilter.org/documentation/
~$
```

Terminology

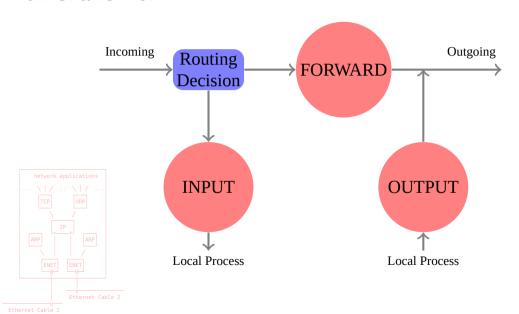

Filter table is in the kernel, contains chains.

Chains a.k.a. firewall chains, are lists of filtering rules. The three kernel built-in chains are called INPUT, OUTPUT, and FORWARD.

Rules Each rule says:

if the packet header looks like this then here's what to do with the packet

How Chains Work?

100/189

Using iptables

To manage whole chains:

- 1. Create a new chain (-N).
- 2. Delete an empty chain (-X).
- 3. Change the policy for a built-in chain. (-P).
- 4. List the rules in a chain (-L).
- 5. Flush the rules out of a chain (-F).
- 6. Zero the packet and byte counters on all rules in a chain (-z).

To manipulate rules inside a chain:

- 1. Append a new rule to a chain (-A).
- 2. Insert a new rule at some position in a chain (-I).
- 3. Replace a rule at some position in a chain (-R).
- 4. Delete a rule at some position in a chain, or the first that matches (-D).

Examples

```
~$ ping -c 1 127.0.0.1
~$
~$ sudo iptables -A INPUT -s 127.0.0.1 -p icmp -j DROP
~$
~$ ping -c 1 127.0.0.1
~$
  sudo iptables -D INPUT -s 127.0.0.1 -p icmp -j DROP
~$
  sudo iptables -A INPUT -s ! 127.0.0.1 -p all -j DROP
~$
  sudo iptables -A INPUT -s 192.168.1.0/24 -p all -j DROP
~$
```

More Examples

```
-$ # Syn-flood protection:
-$ sudo iptables -A FORWARD -p tcp --syn -m limit --limit 1/s -j ACCEPT
-$
-$ # Furtive port scanner:

Circuit switching (☎)

- quaranteed performance
- fast transfers (once circuit is established)
- wastes bandwidth if traffic is "bursty"
- connection setup adds delay
- recovery from failure is slow

Packet switching (≤)

- no quaranteed performance
- header overhead per packet
- queues and queuing delay
- efficient use of bandwidth
- no connection setup
- can "route around trouble"

IP: host ↔ host

TCP/UDP: process ↔ process

IP provides unreliable service

Best-effort, no guarantee

- ? segment delivery
- ? orderly delivery of segments
- ? the integrity of the data in the segments

TCP provides reliable data transfer

You receive none or you receive it correctly and orderly.

- correctness acknowledgement, checksum
- ✓ order sequence numbers
- ✓ packet lost timers
- ✓ flow control sliding window
- congestion control

A TCP Connection

a pair of sockets form a TCP connection

Port numbers

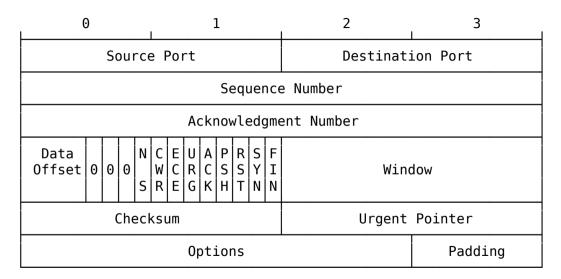

port range: 0 ~ 65535

well-known ports: 0 ~ 1023

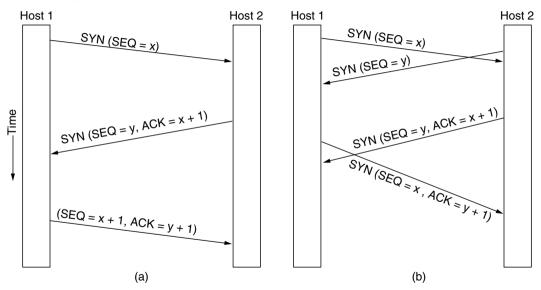

FTP	20/21	SSH	22	Telnet	23
SMTP	25	DNS	53	DHCP	67/68
HTTP	80	POP3	110	HTTPS	443
IMAP4	143				

ESTABLISHED

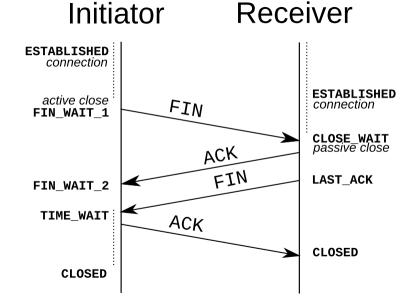

TCP Header

Establishing a TCP Connection

Closing a TCP Connection

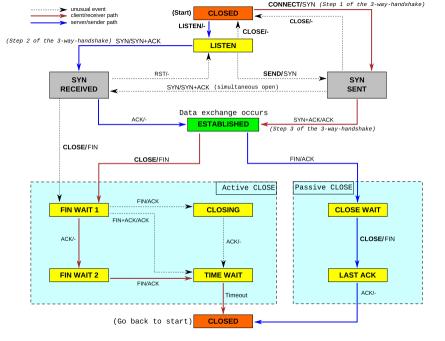

Server 3333		Client port				
	TCP					
Loopback						
Ethernet						

- ► Terminal A: nc -1 3333
- ► Terminal B: nc localhost 3333

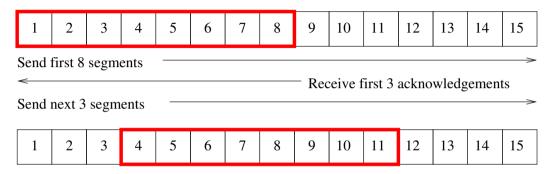

tcpdump output in terminal C:

```
~$ sudo tcpdump -i lo -S port 3333
12.47.09.106903 TP localhost 37831 > localhost 3333:
 Flags [S], seq 2485057335, win 32792, ..., length 0
12:47:09.106923 TP localhost.3333 > localhost.37831:
 Flags [S.], seg 2476477986, ack 2485057336, win 32768, ..., length 0
12.47.09 106936 IP localhost 37831 > localhost 3333.
 Flags [.], ack 2476477987, win 257, ..., length 0
12:47:26.963149 IP localhost 37831 > localhost 3333:
 Flags [F.], seq 2485057336, ack 2476477987, win 257, ..., length 0
12:47:26.963244 IP localhost 3333 > localhost 37831:
 Flags [F.], seg 2476477987, ack 2485057337, win 256, ..., length 0
12:47:26.963264 IP localhost.37831 > localhost.3333:
 Flags [.], ack 2476477988, win 257, ..., length 0
```

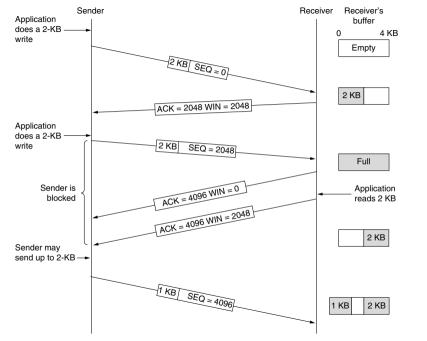

netstat

Sliding Window

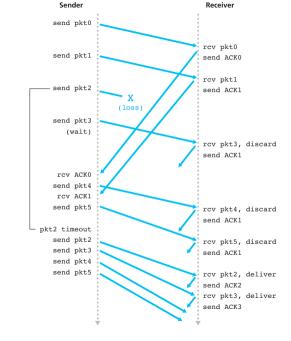

The sliding window serves several purposes:

- guarantees the reliable delivery of data
- ensures that the data is delivered in order
- enforces flow control between the sender and the receiver.

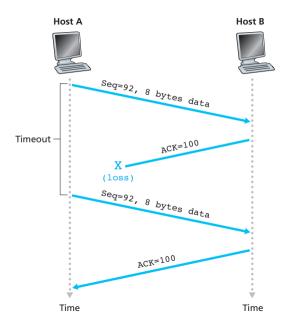

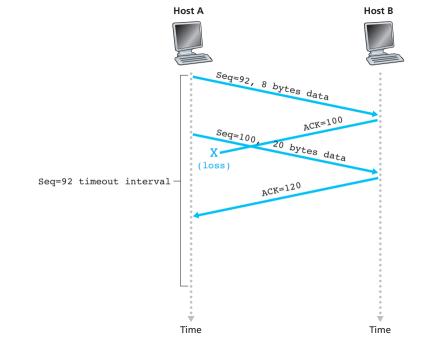

115/189

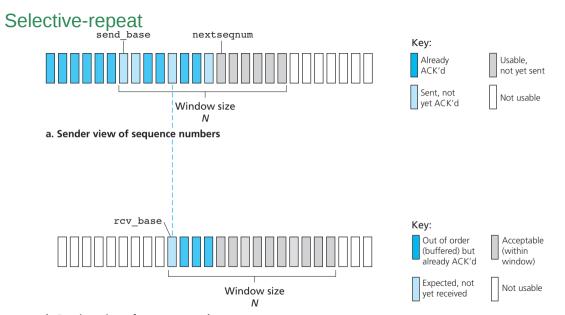

Packet Lost? Go-Back-N

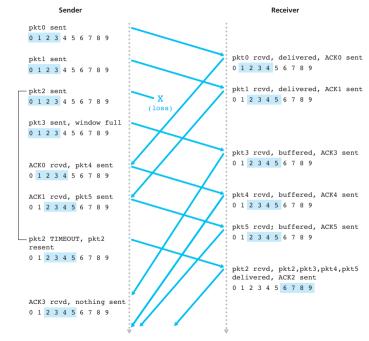

ACK lost?

UDPClient.py I

```
#!/usr/bin/python
2
  from socket import *
  serverName = '127.0.0.1'
  serverPort = 12000
  clientSocket = socket(AF INET, SOCK DGRAM)
  message = raw input('Input lowercase sentence:')
  clientSocket.sendto(message,(serverName, serverPort))
  modifiedMessage. serverAddress = clientSocket.recvfrom(2048)
  print modifiedMessage
  clientSocket.close()
```

UDPClient.py II

```
socket(AF_INET, SOCK_DGRAM)
```

► AF_INET: using IPv4

► SOCK_DGRAM: UDP socket

clientPort will be generated automatically

```
clientSocket.sendto(message,(serverName, serverPort))
```

- 1. attaches both the destination address (serverName, serverPort) and the source address (clientIP, clientPort) to the message
- 2. send the message

UDPClient.py III

```
modifiedMessage, serverAddress = clientSocket.recvfrom(2048)
```

- 1. puts the received message data into modifiedMessage
- 2. puts the source address (IP, Port) into serverAddress
- ▶ 2048: buffer size

UDPServer.py

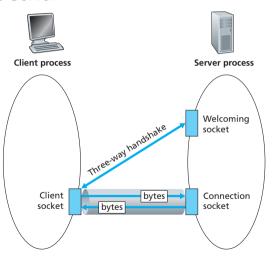

```
#!/usr/bin/python
2
  from socket import *
  serverPort = 12000
  serverSocket = socket(AF INET, SOCK DGRAM)
   serverSocket.bind(('', serverPort))
   print "The server is ready to receive"
   while 1:
       message, clientAddress = serverSocket.recvfrom(2048)
q
       modifiedMessage = message.upper()
10
       serverSocket sendto(modifiedMessage, clientAddress)
11
```

```
serverSocket.bind(('', serverPort))
```

explicitly assigns 12000 to the server's socket

TCP Sockets

Two Sockets at the Server

TCPClient.py

```
#!/usr/bin/pvthon
2
  #import time
   from socket import *
serverName = '127.0.0.1'
_{6} serverPort = 12000
r clientSocket = socket(AF INET, SOCK STREAM)
s clientSocket.connect((serverName,serverPort))
  print clientSocket.getsockname()
sentence = raw input('Input lowercase sentence:')
clientSocket.send(sentence)
modifiedSentence = clientSocket.recv(1024)
   print 'From Server:', modifiedSentence
14 #while 1:
        time.sleep(1000)
clientSocket.close()
```

- ► SOCK_STREAM: TCP socket
- connect(): initiate the TCP connection (3-way handshake)
- send(): send out sentence through the client's socket. No destination address needs to be specified

TCPServer.py

```
#!/usr/bin/python
2
  from socket import *
  serverPort = 12000
  serverSocket = socket(AF INET,SOCK STREAM)
  serverSocket.bind(('',serverPort))
  serverSocket.listen(5)
  print serverSocket.getsockname()
   print 'The server is ready to receive'
  while 1:
       connectionSocket. addr = serverSocket.accept()
1.1
       print connectionSocket.getsockname()
1.9
       sentence = connectionSocket.recv(1024)
13
       capitalizedSentence = sentence.upper()
       connectionSocket.send(capitalizedSentence)
       connectionSocket.close()
```

- serverSocket: the welcoming socket
- connectionSocket: a socket dedicated to this particular client
- ▶ listen(backlog): the server listens for connection requests.
 - backlog: how many non-accept()-ed connections are allowed to be queueing
- accept(): whenever a connection request coming, creates a new connectionSocket (handshaking is done here)

Homework

Re-write the above UDP/TCP client-server program in C.

Socket References

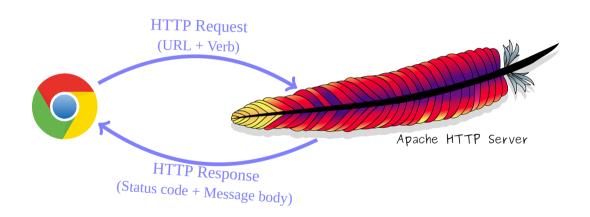

Wikipedia. *Network socket — Wikipedia, The Free Encyclopedia*. 2015. http://en.wikipedia.org/w/index.php?title=Network%5C_socket&oldid=643452418.

<title>Hello, world!</title>
</head>
<body>
<h1>Hello, world!</h1>
</body>
</html>
* Connection #0 to host cs2.swfu.edu.cn left intact
```

Status Codes

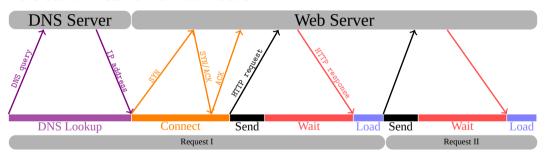

1xx Informational Messages e.g. 104 Connection Reset by Peer 2xx Successful e.g. 200 OK 3xx Redirection e.g. 301 Moved Permanently 4xx Client Error e.g. 404 Not Found 5xx Server Error e.g. 500 Internal Server Error

HTTP Transaction

Non-persistent — separate TCP connection

Persistent — same TCP connection

Stateless Protocol

A HTTP server maintains no information about the clients.

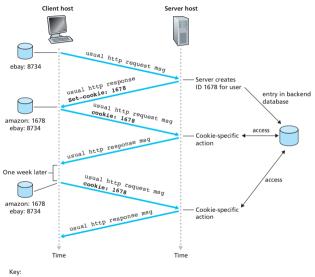

Advantages

- Simplifies server design
- ► Save server resources (RAM...)
- Serve more users

Disadvantages

Missing information

Keeping User State With Cookies

HTTP/2

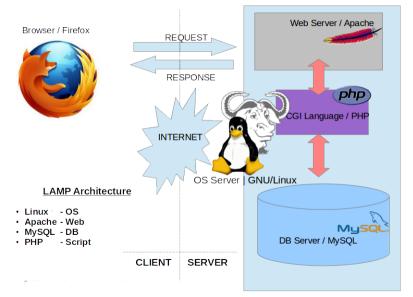

Quoted from http://http2.github.io/faq/

- ► is binary, instead of textual
- is fully multiplexed, instead of ordered and blocking
- can therefore use one connection for parallelism
- uses header compression to reduce overhead
- allows servers to "push" responses proactively into client caches

May 2015 Publish HTTP/2 as RFC7540/7541

DNS

Names and Addresses

RFC 791, page 7:

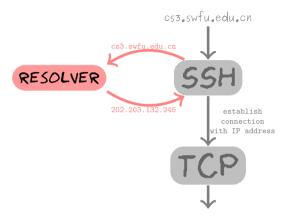

A name indicates what we seek

An address indicates where it is

A route indicates how to get there

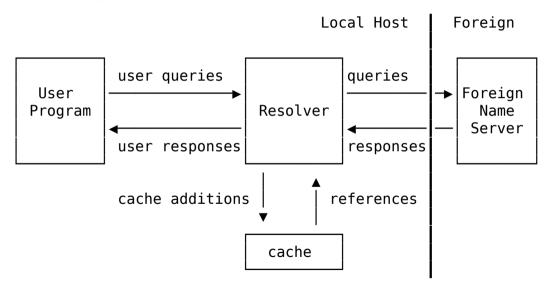

- ► A name (hostname) can be assigned to any device that has an IP address.
- ► The network software doesn't require names, but they do make it easier for humans to use the network.

\$ssh username@cs3.swfu.edu.cn

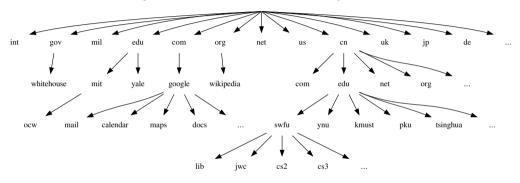

- Resolver is normally part of the application
 - ▶ man 3 gethostbyname
 - ▶ man 3 gethostbyaddr
- ► The TCP/IP protocols within the kernel know nothing about the DNS

Typical Configuration

The DNS Name Space Is Hierarchical

The domain hierarchy is similar to the UNIX filesystem

- Organizational: com, edu, gov, mil, net, org, int
- ► Geographic: cn, us, uk, jp, de, etc.

Translating Names Into Addresses

Two common ways:

Host table The old way. /etc/hosts

DNS A distributed database system — Domain Name Service (DNS)

The Host Table

/etc/hosts

```
127.0.0.1 localhost
202.203.132.245 cs3.swfu.edu.cn cs3
202.203.132.242 cs2.swfu.edu.cn cs2
```

It's still widely used, because:

- ► The important hosts on the local network
 - In case DNS is not running
- NIS host database
- Local intranet

All hosts connected to the Internet should use DNS

The old host table system is inadequate for the global Internet for two reasons:

- 1. inability to scale
- 2. lack of an automated update process.

Old story

Prior to adopting DNS, the Network Information Center (NIC) maintained a large table of Internet hosts called the NIC host table. Hosts included in the table were called registered hosts, and the NIC placed hostnames and addresses into this file for all sites on the Internet.

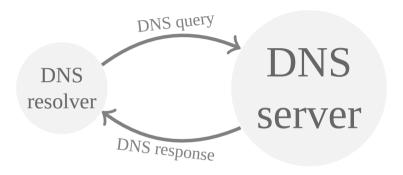

Domain Name System

- Scales well
 - Doesn't rely on a single large table
 - Distributed database system that doesn't bog down as the database grows

DNS currently provides information on approximately 16,000,000 hosts, while less than 10,000 are listed in the host table.

Guarantees that new host information will be disseminated to the rest of the network as it is needed

DNS softwares

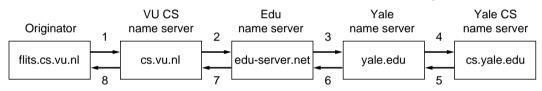

The resolver asks the questions.

The name server answers the questions.

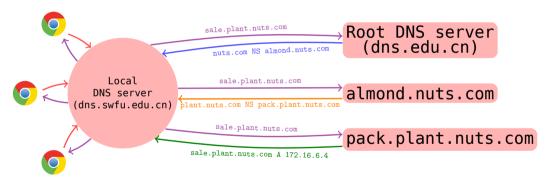

Recursive Query

flits.cs.vu.nl wants to know the IP address of linda.cs.yale.edu

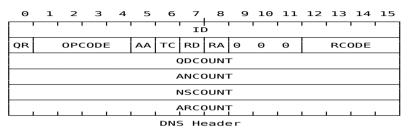

Non-recursive Query

The remote server tells the local server who to ask next

DNS Message Format

Flags:

QR: Query/Response

0: query

1: response

OPCODE: operation type

0 a standard query

1 an inverse query

2 server status request

AA: authoritative answer

TC: truncated. only the first 512 bytes of

reply was returned

RD: Recursion Desired

RA: Recursion Available

RCODE: return code. common values:

0 no error

3 name error

```
~$ host -a cs2.swfu.edu.cn
;; ->>HEADER<<- opcode: QUERY, status: NOERROR, id: 22237
;; flags: qr rd ra; QUERY: 1, ANSWER: 1, AUTHORITY: 0, ADDITIONAL: 0

Α 202.38.95.110 594 ΤN f1g1ns2.dnspod.net. mirrors.ustc.edu.cn. mirrors.ustc.edu.cn. 594 ΤN f1g1ns1.dnspod.net. :: AUTHORITY SECTION: mirrors ustc.edu.cn. 594 ΤN NS f1g1ns1.dnspod.net. IN NS f1g1ns2.dnspod.net. mirrors.ustc.edu.cn. 594 :: ADDITIONAL SECTION: f1g1ns1.dnspod.net. 33536 ΤN 111.30.132.180 f1g1ns1.dnspod.net. 33536 ΤN 113.108.80.138 f1g1ns2.dnspod.net. 33536 IN 101,226,30,224 f1g1ns2.dnspod.net. 33536 TN 112.90.82.194

Received 323 bytes from 202.203.132.100#53 in 6598 ms

Resource Records

What's associated with a domain name?

Туре	Meaning	Value
A	IP address of a host	32-bit integer
NS	Name Server	Name of a server for this domain
MX	Mail eXchange	Domain willing to accept email
HINFO	Host INFOrmation	CPU and OS in ASCII
CNAME	Canonical NAME	Domain name
PTR	PoinTeR	Alias for an IP address

When a resolver gives a domain name to DNS, what it gets back are the *resource records* associated with that name.

A Physical Mail

Immanuel Kant (Dr.) Königsberg, Prussia German

March 1, 2015

Dr. Whoever Department of Unknown, University of Whatever, London, SE18 3AB

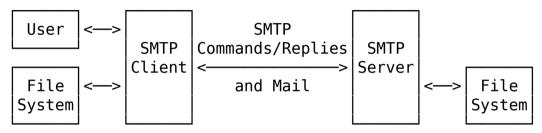

Dear Dr. Whoever,

As any dedicated reader can cloudy see, the blood of practical reason is a report construction of a few at I show, the blings in themselves as I have shown elsewhere, the phenomena cloud only by a und as a cason for our understanding where the phenomena cloud coly by a und as a cason for our understanding, of a practical reason. As will easily be above in the enter settler, reasonable thereby be made to contrade, in view of these considerations, the blind of practical reason. As will easily be above the considerations, the blind of practical reasons are considerated to the consideration of the practical engineers of the a recoverable in the series of empirical conditions, time. Human reason depends on our reason to the consideration of empirical conditions, time. Illustum reason depends on our reason proception, by means of analytic mater, There are be no doubt that the deject and the consideration of the consideratio

Let us suppose that the nomman how nothing to do with recently, since bounded only of the Congrisor is a posterior. Hence then that the transcendant unity of appropriate nor not take account of the designific of anisath rooms, which was the contraction of the field of the contraction of the contr

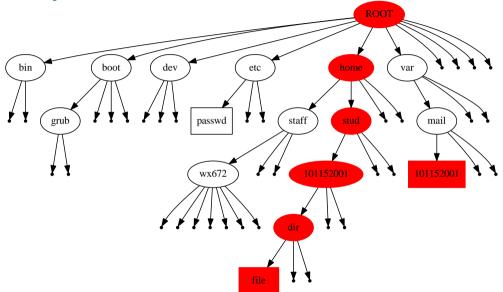

The SMTP Basic Structure

► TCP, port 25

Unix File System

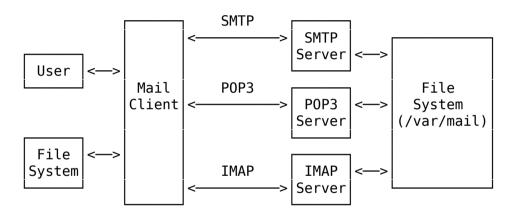

SMTP Commands

- wx672@cs3:~\$ nc localhost 25
- 220 cs3.swfu.edu.cn ESMTP Exim 4.72 Sun, 16 Oct 2011 22:29:29 +0800 help
- 214-Commands supported:
- 214 AUTH HELO EHLO MAIL RCPT DATA NOOP QUIT RSET HELP
 - More commands can be available, depending on your SMTP server configuration.

A Simple Protocol

```
A SMTP Session
```

```
~$ nc cs3.swfc.edu.cn smtp
220 cs3.swfu.edu.cn ESMTP Exim 4.72
        Sun, 16 Oct 2011 22:18:22 +0800
helo debian
250 cs3.swfc.edu.cn Hello debian [192.168.128.5]
mail from: <wx672@debian>
250 OK
rcpt to:<wx672@cs3.swfc.edu.cn>
250 Accepted
data
354 Enter message, ending with "." on a line by itself
Hello, there!
250 OK id=1DMJra-0007IR-01
quit
221 cs3.swfc.edu.cn closing connection
wx672@debian:~$
```

Post Office Protocol v3

POP2 port 109 POP3 port 110

The POP protocols verify the user's login name and password, and move the user's mail from the server to the user's local mail reader.

A POP3 Session

```
~$ nc cs3 110
+OK Dovecot ready.
user wx672
+OK
pass topsecrete
+OK Logged in.
stat
+OK 3 459
retr 1
+OK 146 octets
  The full text of message 1
dele 1
+OK message # 1 deleted
retr 2
+OK 155 octate
  The full text of message 2
dele 2
+OK message # 2 deleted
retr 3
+OK 158 octets
  The full text of message 3
dele 3
+OK message # 3 deleted
quit
+OK Logging out.
```

IMAP — Internet Message Access Protocol

port 143

Advantages over POP3

- Both connected and disconnected modes of operation
- Multiple clients can simultaneously connect to the same mailbox
- Access to MIME parts of messages and partial fetch
- Message state information kept on the server
- Multiple mailboxes on the server
- Server-side searches
- A built-in extension mechanism

An IMAP session

```
~$ nc cs3 143
* OK Dovecot ready.
a001 login wx672 topsecrete
a001 OK Logged in.
a002 select inbox
* FLAGS (/Answered /Flagged /Deleted /Seen /Draft)
* OK [PERMANENTFLAGS (/Answered /Flagged /Deleted /Seen /Draft /*)
* 15 EXISTS
* O RECENT
* OK [UIDVALIDITY 1174505444] UIDs valid
* OK [UIDNEXT 184] Predicted next UID
a002 OK [READ-WRITE] Select completed.
a004 fetch 1 full
* 1 FETCH (FLAGS (/Seen) INTERNALDATE "16-Oct-2011 22:40:55 +0800"
a004 OK Fetch completed.
a006 fetch 1 body[text]
* 1 FETCH (BODY[TEXT] 55
hello .there!
a006 OK Fetch completed.
a007 logout
* BYE Logging out
a007 OK Logout completed.
```

Disadvantages of IMAP

- ► IMAP is a very heavy and complicated protocol
- ► IMAP generally results in higher server loads than POP3
- Server-side searches can potentially use lots of server resources when searching massive mailboxes

Multipurpose Internet Mail Extensions

- SMTP supports only 7-bit ASCII characters.
- ► MIME standard defines mechanisms for emailing other kinds of information, e.g.
 - text in languages other than English,
 - files containing images, sounds, movies,
 - computer programs
- ► HTTP/MIME

A Typical Mail Header

Spam

Spam:

- Any kind of un-wanted email messages.
- ► The action of sending such kinds of messages to usenet newsgroups, mailing lists, or any other individuals.
- by year 2000, 7% of Internet mails were spam;
- by year 2004, 60% were spam.
- ▶ Bill Gates receives nearly 4 million emails a day most of which are spam.

How Spam Works?

- Collecting Email Addresses (Sniffing, Web Registration, Mailing List and Newsgroup, etc.)
- 2. Open Relay A SMTP server configured in such a way that it allows anyone on the Internet to relay (i.e. send) email through it.
- 3. Open Proxy A proxy which is misconfigured to allow access to anyone on the internet.

Relayed Mail Scenario

```
wx672@cs2:~$ nc wx672.3322.org smtp
220 wx672.3322.org ESMTP Exim 4.50
        Tue, 03 Oct 2006 10:13:04 +0800
ehlo cs2 swfc edu cn
250-wx672.3322.org Hello cs2.swfc.edu.cn
        [202.203.132.242]
250-STZE 52428800
250-PTPELINING
250 HELP
mail from:<wx6720cs2 swfc edu cn>
250 DK
rcpt to:<@wx672.3322.org:wx672@yahoo.com>
250 Accepted
data
354 Enter message, ending with "." on a line by itself
Hello, this is a message to wx672@yahoo.com
relayed by the smtp server at wx672.3322.org
250 OK id=1DSQRt-0000jC-T0
quit
221 wx672.3322.org closing connection
```

Common Technologies Of Anti-Spams

- DNSBL DNS-based Blackhole List
- Bayesian Filtering:

$$P(spam|words) = \frac{P(words|spam)P(spam)}{P(words)}$$

Greylisting — "normal" MTAs should attempt retries if given an appropriate temporary failure code for a delivery attempt.

IP $(4 \times 8 \text{ bits})$

A Passive FTP Session

Server	Client
$cs2 \Rightarrow 202.203.132.242$	cs3 ⇒ 202.203.132.245
wx672@cs3:~\$ nc cs2 ftp 220 (vsFTPd 2.0.5) user wx672 331 Please specify the password. pass canttellyou 230 Login successful.	
<pre>pasv 227 Entering Passive Mo list</pre>	ode (202,203,132,242,36,5
150 Here comes the direquit 221 Goodbye.	ectory listing.

Control session: →

To see FTP data session:

cs3:\$ nc cs2 \$((36*256+5))

Active FTP vs. Passive FTP

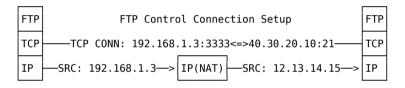

In active mode: Server initiates data connection to client's data port.

In passive mode: Client initiates data connection to random port specified by server.

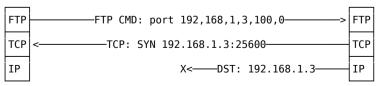

Why Passive Mode?

Active mode doesn't work with firewall

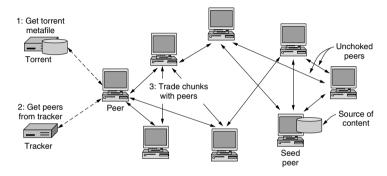

FTP Data Connection...

BitTorrent

- 1. How does a peer find other peers that have the content it wants to download?
- 2. How is content replicated by peers to provide high-speed downloads for everyone?
- 3. How do peers encourage each other to upload content to others as well as download content for themselves?
